VOLUME **16**

PAVERS, SLABS, WALLS,
STEPS & CAPS, EDGES AND
OUTDOOR FEATURES

COLOUR

Due to the inherent nature of printed literature and current digital media, Techo-Bloc cannot guarantee specific colour matching to printed representations of its colour swatches.

Each colour option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another. Therefore, colour samples shown are approximate representations of our standard colours and actual product colours may vary.

Final colour selection should be made at your local dealer from stocked product. Techo-Bloc always recommends immediately verifying the product and colour upon reception. If there are any discrepancies, contact your local dealer before continuing your project. Installation of the product constitutes your acceptance of the product as is.

PROPER COLOUR DISTRIBUTION AND LAYING TECHNIQUES

Proper installation enhances the overall colour of pavement. Units should be randomly picked from at least two pallets when installing. This creates an attractive and subtle blending of colour.

EFFLORESCENCE

This warranty does not apply to efflorescence. Efflorescence is a natural occurring process in all concrete products which sometimes appears in the form of a white powdery film on the pavement surface. Efflorescence is more perceivable in darker colours such as Onyx Black and Chocolate Brown as there is a higher level of contrast than with other blended colours. It does not, in any way, compromise the functionality or the structural integrity of the product. Although efflorescence cannot be prevented, it will wash off over time or can be cleaned with efflorescence cleaner. Techo-Bloc accepts no responsibility or liability for this condition.

POLYMERIC HAZE

Polymeric haze from the use of polymeric joint sand may appear on your concrete products if the sand was not removed from the surface of the paver properly. This does not, in any way, affect the integrity of the product or your installation. The hazing will weather away naturally with time and rain. It can be removed with a specialized cleaner; you are advised to contact your contractor or the polymeric sand company used for advice on recommendations. Techo-Bloc accepts no responsibility or liability for this occurrence.

CONSTRUCTION RESIDUE

A by-product of cutting with a saw is residue-filled water or concrete dust. Residue-filled water or re-hydrated dust can cling to the surface and leave a concrete stain. It is recommended to wash and remove the water or concrete dust from the surface of the pavers before it dries. Construction residue can also happen through soil disturbance or environmental elements. These contaminants should be removed immediately but do not affect the integrity of the product or your installation. Techo-Bloc accepts no responsibility or liability for these occurrences.

COMPACTOR AND SNOW REMOVAL EQUIPMENT

Pavers with an embossed surface (high and low points) are more susceptible to scuff marks from vibratory plate compactors used in most concrete paver installations. Techo-Bloc recommends the use of a urethane mat between the plate and the paver surface during compacting. Contact your equipment supplier for more information about accessories for this purpose. Also, snow removal equipment should have the proper spacing, bumpers, and rubber blade guards to protect the surface of the pavers. Techo-Bloc is not responsible for damage caused by the misuse of compaction or snow removal equipment, which may leave scuff marks, or burns on pavers.

TECHO-BLOC WARRANTY

TECHO-BLOC IS PROUD TO CERTIFY *that our paving stones and retaining walls meet the latest industry standards in Canada and the United States of America. All Techo-Bloc manufactured landscape products comply with and surpass all applicable standards established by the CSA (Canadian Standards Association), ASTM (American Society for Testing and Materials) and the BNQ (Bureau de normalisation du Québec), recognized as the strictest standards throughout the world.*

TECHO-BLOC OFFERS A TRANSFERABLE LIFETIME WARRANTY *on the structural integrity of all paving stones and retaining wall stones it manufactures. It covers any disintegration and/or decomposition of the abovementioned products resulting from natural causes and the abnormal deterioration of the surface due to the use of sodium chloride (NaCl) such as de-icing salt.*

IF PRODUCTS PROVE DEFECTIVE, *we will replace these units. Techo-Bloc's responsibility is limited to its products only and not to the costs related to the installation of those products. Techo-Bloc will honor this transferable lifetime warranty with a proof of purchase such as an invoice or delivery slip.*

STONEDGE COLLECTION WARRANTY

STONEDGE™ LANDSCAPE AND MASONRY PRODUCTS *are manufactured under the highest standards of quality and workmanship. This warranty is offered to the original Consumer Purchaser (Homeowner), for as long as they own their home. STONEDGE™ warrants that the product is free from defects in material and workmanship, and is in compliance with the specifications of the Canadian Standards Association and the American Standards for testing Materials.*

NOTE: This warranty does not apply to any breakage, chipping, natural wear or other deterioration that were caused from improper design or installation which does not comply with applicable codes, the ICPI *(Interlocking Concrete Pavement Institute)*, NCMA *(National Concrete Masonry Association)* and recognized work procedures. This warranty does not apply to any damage resulting from a natural disaster or from a deliberate and/or negligible act on the part of the purchaser, owner of the building, installer or any third party.

For industry information about efflorescence, polymeric haze or information pertaining to installation specifications, please visit **www.icpi.org** or **www.ncma.org**.

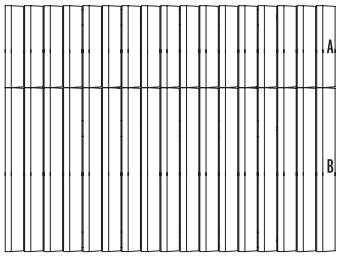
SLABS

PATIOS, WALKWAYS, POOLSIDES
& STEPPING STONES

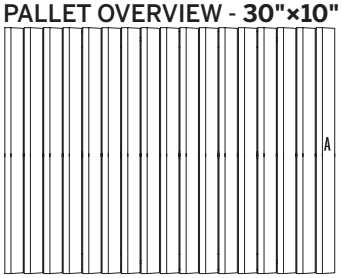
Aberdeen

DESCRIPTION: Slab
TEXTURE: Slate

PALLET OVERVIEW - 20"×10" and 20"×20"



PALLET OVERVIEW - 30"×10"



APPLICATIONS

Available in random, linear and diamond shapes, Aberdeen slabs are ideal for a wide variety of applications. Use them for patios, footpaths (linear) or giant steppers, as caps for seating and retaining walls, and, when combined in footpath or multileveled patios, as caps for steps.

The Aberdeen slabs cannot be used for driveways.

NOTES

Palletized upright.

* For an authentic look, each color option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another.

See page 160 for more technical information.

Specifications per pallet		Imperial	Metric

Monticello

DESCRIPTION: Slab
TEXTURE: Slate with chiseled edges

PALLET OVERVIEW

Specifications per pallet		Imperial	Metric
20"×30"	Cubing	**70.83 ft²**	6.58 m²
	Weight	1 870 lbs	848 kg
	Number of rows	1	
	Coverage per row	4.17 ft²/unit	0.39 m²/unit
	Linear coverage per row — Depth	28.3 lin. ft/row	8.63 lin. m/row
	Length	42.5 lin. ft/row	12.95 lin. m/row

Unit dimensions	in	mm	Units/pallet
Height	2 ¼	57	17 units
Depth	20	508	
Length	30	762	

APPLICATIONS

Pedestrian traffic, patios and swimming pool decks.

The Monticello slabs cannot be used for driveways.

NOTES

Palletized upright.

* For an authentic look, each color option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another.

See page 160 for more technical information.

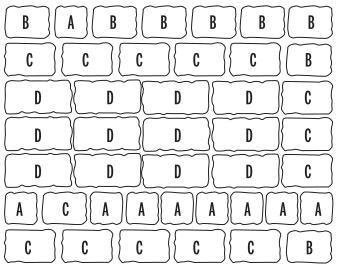
Allegro

DESCRIPTION: Paver
TEXTURE: Undulated and aged

PATENT 2,214,295

PALLET OVERVIEW



APPLICATIONS

Pedestrian or light vehicular traffic, residential driveways, patios and swimming pool decks.

The Allegro paver allows for gentle curves and winding pathways eliminating the need for cuts.

NOTES

See page 150 for more technical information.

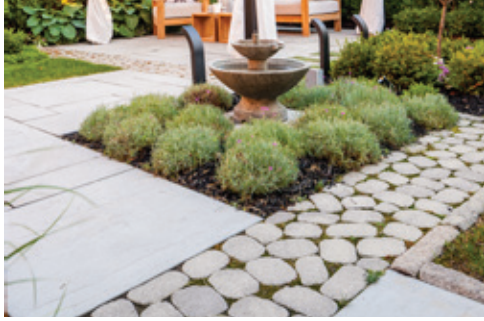
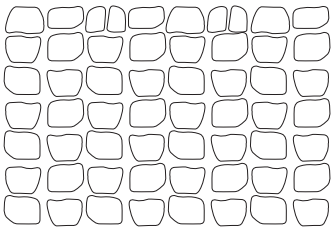
Antika

DESCRIPTION: Paver
TEXTURE: Smooth and aged



PAVERS

PALLET OVERVIEW



APPLICATIONS

Pedestrian or light vehicular traffic, residential driveways, patios and swimming pool decks.

The Antika paver is perfect as a filler in a circle, around a fan design or on a winding pathway. Antika can also be used as a mosaic frame around any design.

NOTES

See page 150 for more technical information and page 156 when used as a permeable application.

PALLET OVERVIEW

Specifications per pallet	Imperial	Metric
Cubing	**62 ft²**	5.76 m²
Weight	2 710 lbs	1 229 kg
Number of rows	8	
Coverage per row	7.75 ft²/row	0.72 m²/row
Linear coverage per row	11.80 lin. ft/row	3.60 lin. m/row
Void space	5.8%	
Joint Depth	1/2"	13 mm

Unit dimensions	in	mm	Units/pallet
Height	3 15/16	100	96 units
Depth	7 7/8	200	
Length	11 13/16	300	

APPLICATIONS

- For industrial, commercial and municipal paving projects.
- LEED® Projects.
- Reduces stormwater runoff to municipal sewers.
- Eliminates the need for retention basins and optimizes the use of land.

CHARACTERISTICS

- Mechanical connection (tongue and groove system).
- 6000 to 8000 sq. ft can be installed per day with the TB100SI and a team of 5 persons.
- Maintains its interlocking properties, over time and under heavy traffic loads.

NOTES

See page 150 for more technical information and page 156 when used as a permeable application.

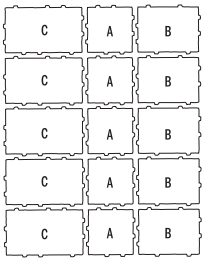
Pure

DESCRIPTION: Paver
TEXTURE: Beveled

PALLET OVERVIEW



APPLICATIONS

Pedestrian or light vehicular traffic, residential driveways, patios and swimming pool decks.

The use of permeable pavement systems throughout the world has proven effective in reducing storm water runoff while increasing infiltration rates as it returns the water to the environment. The use of permeable pavers also facilitates LEED® certification easier to obtain.

WALLS

WALLS, PILLARS & PLANTERS

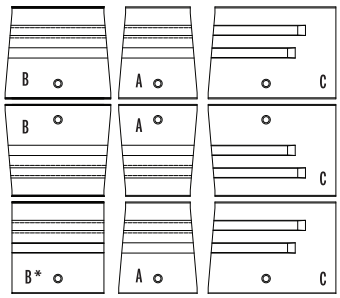
Baltimore

90 mm

DESCRIPTION: Wall double-sided
TEXTURE: Sculpted

PALLET OVERVIEW

Pallet layout may vary.



APPLICATIONS

Versatile units that can be used to build planters, double and single walls, steps, edge restraints, pillars, fireplaces and exterior kitchen components.

COMPATIBLE CAPS

Aged, Escala 3.5", Muro Naturale, Piedimonte, Portofino, Prima 14", Raffinato and York.

NOTES

When building a double-sided wall one pallet will cover an average of 20 ft².

The positioning of the modules on the pallet may vary.

See page 162 for more technical information.

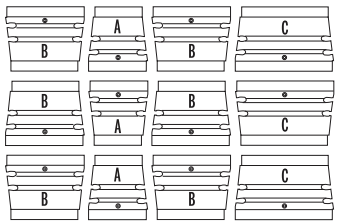
Prescott

2.25"

DESCRIPTION: Wall double-sided
TEXTURE: Natural stone

PALLET OVERVIEW



APPLICATIONS

Versatile units that can be used to build planters, double and single walls, edge restraints, pillars, fireplaces and exterior kitchen components.

COMPATIBLE CAPS

Muro Naturale, Piedimonte, Portofino, Raffinato and York.

NOTES

* For an authentic look, each color option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another.

When building a double-sided wall one pallet will cover an average of 25.23 ft².

See page 162 for more technical information.

Height	6	152	2 units
Depth 1	15 1/4	387	
Depth 2	14 5/8	371	
Length	60	1 524	

NOTES

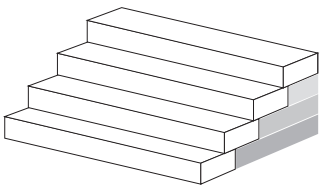
Röcka 48" is a double-sided step. Each side has slight natural texture differences. Please take that into consideration when installing them side by side. We recommend keeping the same texture together.

Please note that there is a slight vertical angle on the front and back faces of the step 3/8", from the bottom to the top of the step.

To achieve a natural appearance, stone dimensions can vary up to 1/4" in width.

* For an authentic look, each color option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another.

See page 232 for more technical information.



Röcka
Wall & Edge

When building a staircase, the Rocka wall can be used to complete the sides and act as part of a structural system. See the product specifications on page 85.

York
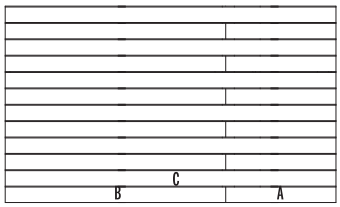
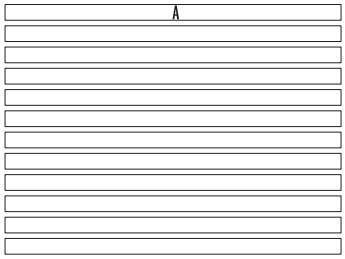
Wall Caps

DESCRIPTION: Wall Caps
TEXTURE: Limestone surface with chiseled edges

PALLET OVERVIEW - 14"×16", 14"×32" & 14"×48"



PALLET OVERVIEW - 14×48



APPLICATIONS

Multi-purpose York caps are the right choice for more than capping seating walls. Use them to cap retaining walls and double-sided fence walls, or as pool copings. They are ideal in slab applications and pathways, and you can continue your design by installing them as steps or use them as steppers across a lawn or pool. The perfect bar top, a York cap even makes a great low coffee table.

COMPATIBLE WALLS

Baltimore 90 mm & 180 mm, Brandon 90 mm & 180 mm, Escala 3.5", Mini-Creta 3" & 6", Mini-Creta 3" & 6" Architectural, Prescott 2.25" & 4.5", Semma and Suprema.

NOTES

Palletized upright.

Techo-Bloc always recommends gluing the caps with concrete adhesive to ensure stability and safety.

To acheive a natural appearance, stone dimension can vary up to ¼".

Metric measures are approximate.

* For an authentic look, each color option is composed of a variety of darker & lighter tones. Natural ingredients such as granite are present within the recipe to allow for a range in tones, veining and textures from one stone to another.

HIGH

Raffinato

Fire pit

DESCRIPTION: Fire pit
TEXTURE: Smooth

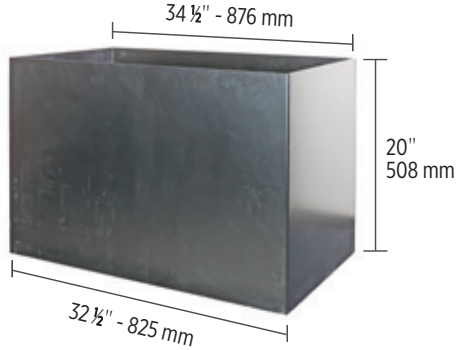
NOTES

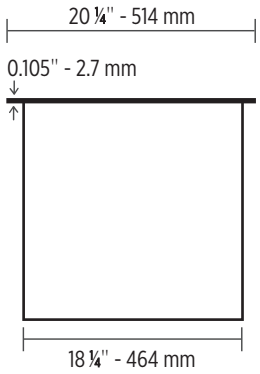
Sold as a kit not pre-assembled.
12"×24" caps inculded.

Techo-Bloc is not responsible for any damages to the firepit if it is not installed with a sleeve or accessory kit.

See page 247 for more technical information.

Specifications per pallet	Imperial	Metric
Weight	2 700 lbs	1 225 kg
Height	21 1/4"	540 mm
Width	41 1/2"	1 054 mm
Length	55 7/8"	1 419 mm
12"×24" caps	8	
Raffinato 90 mm corner block	10	
Raffinato 180 mm corner block	20	





greyed nickel

beige cream

The Raffinato fire pit kit includes colour accent pieces in each kit : the Greyed Nickel version includes Onyx Black accents; the Beige Cream includes Greyed Nickel accents.

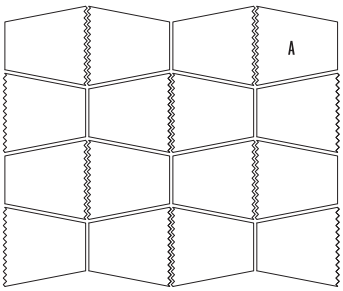
Valencia

Fire pit

DESCRIPTION: Fire pit
TEXTURE: Split face and aged

TECHO-BLOC WARRANTY APPLIES TO VALENCIA STONES
THE WARRANTY **DOES NOT APPLY** TO ACCESSORY KIT

PALLET OVERVIEW



Specifications per pallet	Imperial	Metric
Cubing	**80 units**	80 units
Weight	1 525 lbs	692 kg
Height	14 3/4"	0.375 m (375 mm)
Exterior Diameter	48 15/16" (4' 1")	1.243 m (1 243 mm)
Interior Diameter	29 1/8" (2' 5")	0.74 m (740 mm)
Number of rows	5	

Unit dimensions	in	mm	Units / pallet
Height	2 15/16	75	80 units
Depth	9 13/16	250	
Length	9 3/4	247	

APPLICATIONS

Circular garden wall or when used with Valencia fire bowl kit, converts to a fireplace.

NOTES

A Spark screen should always cover the fire bowl when the fireplace is in use.

Techo-Bloc is not responsible for any damages to the firepit if it is not installed with a sleeve or accessory kit.

See page 243 for more technical information.

sandlewood | shale grey | mojave beige | champlain grey | harvest gold | chestnut brown | autumn red

Grill Island

Mini-Creta

DESCRIPTION: BBQ Grill Island
TEXTURE: Split face

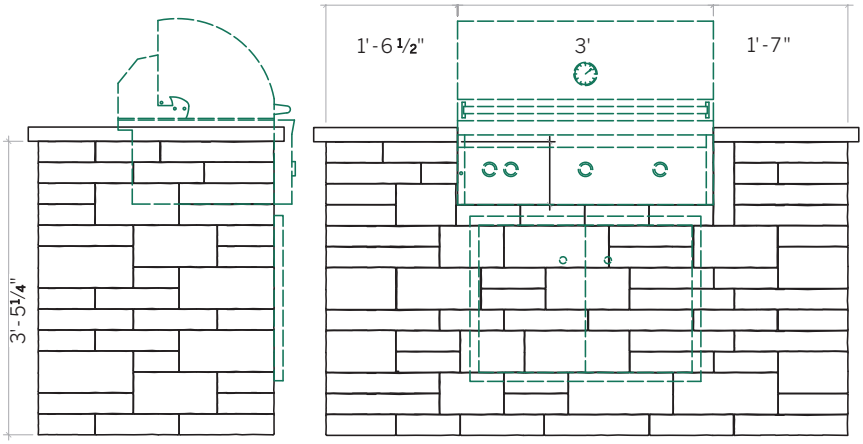
NOTES

See page 241 for more technical information.

* Colours only available in half-pallets.

Not sold pre-assembled.
Appliances not included.

WARNING:
When installing the built-in grill, refer to the manufacturer's instruction guide for all specifications and requirements for natural gas or propane tank location, installation and ventilation.



REQUIRED PRODUCTS

ADDITIONAL INFORMATION

Solar Reflectance Index

Solar Reflectance Index (SRI) is a composite measure that combines surface's solar reflectance and emittance. Essentially, the SRI is an indicator of how well a surface reflects (reflectance) and release absorbed solar radiation (emittance). The lower the SRI, the hotter a material is likely to become in the sunlight. High SRI surfaces can help reduce the urban heat island that causes cities to stay warmer which contributes to increase energy consumption for air conditioning systems and air pollution.

Summary of LEED® criterion for credits on heat island reduction applicable to paving products for non-roof and parking cover applications (minimum values):

			INITIAL	3-YEAR AGED
NON-ROOF APPLICATIONS	LEED 2009	Solar Reflectance Index (SRI)	29	-
	LEED v4	Solar reflectance	0.33	0.28
PARKING COVER APPLICATIONS	LEED 2009	Solar Reflectance Index (SRI)	29	-
	LEED v4	Solar Reflectance Index (SRI)	39	32

Solar reflectance and SRI values for Techo-Bloc landscaping products, as tested by independent testing laboratory:

COLOR	SWATCH	SOLAR REFLECTANCE	SOLAR REFLECTANCE INDEX (SRI)
Autumn red		0.15	14
Azzurro		0.15	12
Baja Beige		0.38	42
Beige Cream		0.30	32
Brazilian sand		See note below	
Brushed pewter		See note below	
Champlain grey		0.23	25
Charcoal		See note below	
Chestnut brown		0.23	25
Chocolate brown		See note below	
Coral Sands		0.40	45
Grey		0.30	34
Greyed Nickel		0.32	35
Harvest gold		0.18	18

COLOR	SWATCH	SOLAR REFLECTANCE	SOLAR REFLECTANCE INDEX (SRI)
Hazelnut Brandy		0.23	23
Ivory		0.46	53
Mojave beige		0.26	29
Olive		0.17	15
Onyx black		See note below	
Red & black		See note below	
Riviera		0.20	19
Rock Garden Brown		0.21	20
Sandlewood		0.21	23
Sauvignon Oak		0.35	38
Shale grey		0.24	26
Smoked Pine		0.12	9
Victoria		0.36	40

Note: Since the overall objective of the SRI is to encourage light colored surfaces, these colors were not tested either because of their darkness or they were not applicable to paving products.

INSTALLATION GUIDE

Physical and geometrical characteristics

All interlocking pavers, slabs and walls manufactured by Techo-Bloc follow strict regulations in their components, be it sand, stone, cement or colour. They are all vigorously tested for maximum quality control. Techo-Bloc pavers are manufactured with zero slump concrete and cured in a controlled environment. All pavers must meet the following standards: ASTM C936 and CSA A231.2 which are recognized as the strictest in the world. The main components of these standards can be summarized as follows:

Interlocking Concrete Pavement

CHARACTERISTICS	ASTM C936	TECHO-BLOC
Compressive strength	8 000 psi [55 MPa] at 28 days	8 000 psi at 28 days
Durability to freeze thaw cycles	Total mass loss after 50 cycles, no greater than 1%	Total mass loss after 50 cycles, no greater than 1%
Water absorption	Lower than 5%	Lower than 5%
Dimension tolerance	± 1/8" [3.2 mm] height ± 1/16" [1.6 mm] length and width	± 1/8" height ± 1/16" length and width
CHARACTERISTICS	**CSA A231.2**	**TECHO-BLOC**
Compressive strength	7 200 psi [50 MPa] min.	7 200 psi [50 MPa] min.
Freeze-thaw durability with use of deicing salt	Loss of 0.046 lb/ft² [225 g/m²] max. at 28 cycles Loss of 0.102 lb/ft² [500 g/m²] max. at 49 cycles	Loss of 0.046 lb/ft² [225 g/m²] max. at 28 cycles Loss of 0.102 lb/ft² [500 g/m²] max. at 49 cycles
Water absorption	-	5% (max.)
Dimension tolerance	± 1/8" [3 mm] height -1/32" [1 mm] to +1/16" [2 mm] length and width	± 1/8" [3 mm] height -1/32" [1 mm] to +1/16" [2 mm] length and width

Slabs

CHARACTERISTICS	CSA A231.1	TECHO-BLOC
Compressive strength	-	6 500 psi [45 MPa] min.
Flexural strength	650 psi [4.5 MPa] min.	650 psi [4.5 MPa] min.
Freeze-thaw durability with use of deicing salt	Loss of 0.102 lb/ft² [500 g/m²] max. at 28 cycles Loss of 0.246 lb/ft² [1200 g/m²] max. at 49 cycles	Loss of 0.102 lb/ft² [500 g/m²] max. at 28 cycles Loss of 0.246 lb/ft² [1200 g/m²] max. at 49 cycles
Water absorption	-	5% (max.)
Dimension tolerance	± 1/8" [3 mm] height -1/32" [1 mm] to +1/16" [2 mm] length and width	± 1/8" [3 mm](height -1/32" [1 mm] to +1/16" [2 mm] length and width
Warpage	± 1/16" [2 mm] Dimension of 17 11/16" [450 mm] and less ±1/8" [3 mm] Dimension over 17 11/16" [450 mm]	± 2 mm ± 3 mm

Walls

CHARACTERISTICS		WALLS (OTHER THAN "MONUMENTAL")		"MONUMENTAL" WALL	
		ASTM C 1372[4]	TECHO-BLOC	MTQ[5]	TECHO-BLOC
Compressive strength		3 000 psi [21 MPa] min.	5 050 psi [35 MPa] min.	5 050 psi [35 MPa] min.	5 050 psi [35 MPa] min.
Durability to freeze thaw cycles Mass loss		after 100 cycles 1 % (max.)	after 100 cycles 1 % (max.)	after 49 cycles 0.123 lb/ft² [0.60 kg/m²] max	after 49 cycles 0.123 lb/ft² [0.60 kg/m²] max

Notes :
1. The dimension tolerance is not applicable to split facings or other architectural finish.
2. CSA A231.2, Precast concrete pavers.
3. CSA A231.1, Precast concrete paving slabs.
4. ASTM C 1372, Standard Specification for Dry-Cast Segmental Retaining Wall Units.
5. MTQ, requirement according to the *Ministère des Transports du Québec* standard for certified walls.

Installation guide
INTERLOCKING CONCRETE PAVEMENT

Installation outline

01 EXCAVATION

A. Before excavating, call all the local utility companies (e.g., phone, gas, electrical) to ensure that the area in which you plan to dig is clear of underground cables or wires. If any are found, please notify the appropriate companies before you begin.

B. When excavating, it is important to achieve a slope in increments of 1.5% (3/16" per ft/5 mm per 300 mm), which will allow for proper drainage. The excavation should mirror the final grade of pavement.

C. The width of the base behind the edge should be equivalent to the thickness of the base.

D. Using a rake, grade the bottom of the excavated area. If the natural soil is granular or sandy, we recommend that you compact the soil with a vibrating plate. If the soil is clay-like, change the soil with a blend of lime and crushed stone prior to compaction. Next, cover it with a layer of geotextile fabric to prevent the contamination of the base (clay and 0-3/4"[0-20 mm] crushed stone). Refer to the table "**Thickness of the Granular Foundation**" (on next page) to find the minimum thickness of foundation required.

02 FOUNDATION

A. Install a 0-3/4" (0-20 mm) crushed stone base, in 4" (100 mm) lifts with a minimum 5,000 lbf (22 kN) vibrating plate compactor.

B. To facilitate compacting, wet the base material thoroughly and compact with a vibrating plate proceeding in all directions Continue this process until you have achieved the desired height. At this stage, you can verify the final height with the help of a paver.

C. Base tolerance ± 3/8" (10 mm) for every 10' (3-m) increment.

03 THE SETTING BED

A. On the compacted crushed base, install two pipes with an outside diameter of 1" (25 mm). Grade the concrete sand with the help of a straight edge (or Quick-E leveler). If the base is not properly graded and smooth, imperfections will be evident in the finishing grade of the pavement.

B. Bedding sand should not be compacted until all paving stones have been laid down. Passing the vibrating plate over the paving stones causes them to settle approximately 3/8" (10 mm) into the bedding sand.

04 INSTALLATION OF PAVING STONES

A. Once the choice of paving stones and the design have been finalized, we recommended that you start installing the pavers at a 90-degree angle. To do so, proceed as follows: measure a first horizontal line of 3' (1-m) and a second line of 4' (1.2 m) perpendicular to the first. Connect a third straight line of 5' (1.5 m) which will form a triangle. The result will be a perfect 90-degree angle. While installing the paving stones, walk on the installed pavers, and fill in gaps caused by the pipes with concrete sand.

B. It is always recommended that you use more than two cubes at a time in order to maximize the colour blend. Furthermore, you should proceed with the cubes from top to bottom.

C. You may use a chalk line to mark the stones to be cut along the borders, using a guillotine or a concrete saw. When cutting paving stones, we recommend that you wear protective ear and eyewear.

D. Once you finish installing the paving stones, you can then install Tundra, Avignon, Belgik or Pietra curbstone on the granular base. To keep curbs in place, add mortar along the back to form a 45-degree angle between the ground and the curbstone or, when available, using the plastic retention system. In a vehicular traffic application, the mortar must be reinforced using steel rods.

05 FILLING IN JOINTS

A. Spread out the polymer stabilizer sand on the paving stones and sweep in between joints in all directions.

B. Pass a vibrating plate in all directions to allow sand to penetrate between the joints.

C. Sweep once more and remove excess sand. Follow the instructions exactly as indicated on the polymer stabilizer sand packaging.

Installation guide

INTERLOCKING CONCRETE PAVEMENT

VIBRATING PLATE ALERT!

Avoid scuffs on paver surfaces. Pavers with embossed surfaces (high and low points) are more susceptible to scuff marks from plate compactors. Techo-Bloc recommends the use of urethane mats between the plate and the paver surface when compacting. Techo-Bloc will not be held responsible for compaction scuffs or burns on pavers.

THICKNESS OF THE GRANULAR FOUNDATION[1]		
RESIDENTIAL PROJECTS	TYPE OF EXISTING SOIL	
	Clayey or Silty[2]	Sandy or Gravelly
Driveways	300 to 500 mm (12" to 20")	200 to 350 mm (8" to 14")
Patios and Walkways	250 to 350 mm (10" to 14")	150 to 200 mm (6" to 8")

1. Data shown in this chart are provided as guidelines only. The range of values suggested depends particularly on existing soil conditions. The thicker the granular foundation, the greater the increase in stability of the whole structure.
2. In the case of unstable soils or ones particularly affected by the freeze-thaw cycles, a thicker foundation may be necessary. For soils with these conditions or for commercial, industrial, or institutional works, a geotechnical professional should be consulted.

QUANTITY CHART FOR JOINTS FILLING

Approximate surface coverage per 50 lbs (22.7 kg) polymeric sand bag.

Installation guide
SEGMENTAL PERMEABLE PAVEMENT

Installation outline

01 DATA COLLECTION

A. Determine the size, shape, and intended use of finished areas (i.e. residential driveway, secondary commercial parking, etc.).

B. Classify sub-grade soils.

C. Document all existing conditions (i.e. fixed points, existing grades, site contours, etc.).

D. Document soil type, location, and elevation of below grade and overhead utilities both public and private.

E. Ensure public utilities are marked through the use of a locating service.

F. Determine the cross section design of the system based on soil type and application, showing proposed sub-grade and finished grade elevations and all geotextiles and drainage pipes needed for the construction.

G. Establish the type, location, and elevation of relief structures if required (i.e. overflow pipe discharging to rain garden, etc.).

H. Determine the curb or edge restraint type, elevation, and location.

I. Choose a pattern appropriate to the application (traffic type and load).

02 EXCAVATION

A. Before digging, contact the concerned companies if wires or pipes are located in the area to be excavated.

B. Excavation depth is determined from the foundation thickness according to the project specifications (foundation thickness is determined by a qualified engineer based on structural and hydrological analyses).

C. Although the slope of the sub-grade will depend on the drainage design and infiltration type, a minimum slope of 0.5% (1/16" per ft, or 5 mm per meter) is recommended.

D. The distance that the excavated area should extend beyond the area to be paved should be one to 1.5 times the thickness of the foundation. This extra space will ensure the stability of the pavers near the edge and the edge restraints.

E. Level the bottom of the excavated area with a rake.

Compaction will reduce the permeability of the sub-grade and it should be executed according to the project specifications. If compaction is not specified, care should be taken to maintain undisturbed soil infiltration during excavation and construction. Stabilization of the sub-grade may be required with weak, continually saturated soils, or when subject to high traffic conditions. If the compaction or stabilization of sub-grade is necessary, reduced infiltration may require drainage pipes within the sub-base to conform to storm water drainage requirements.

03 GEOTEXTILE, IMPERMEABLE LINERS, AND DRAIN PIPES

A. Use the geotextile specified and install it according to project specifications. The use of a woven geotextile with bi-axel strength that meets design criteria is recommended.

B. Place the geotextile on the bottom and sides of the soil sub-grade. Eliminate wrinkles in the geotextile and ensure it is not damaged during construction.

C. Overlap of geotextile should be a minimum of 2' (600 mm) in the direction of drainage. Overlapping should be “shingle” style with respect to any slope direction and base stone distribution direction. Keep properly tensioned, eliminate wrinkles, and avoid damaging fabric (no spikes).

D. If impermeable liners are required, install them according to project specifications and manufacturer’s instructions. Impermeable liners are used when full exfiltration from the reservoir (sub-base and base) into the underlying subgrade is not allowed (no infiltration design). Perforated drainage pipes are usually required in no infiltration and partial infiltration designs.

E. If drainage pipes are required, install them according to project specifications. The aggregate cover over drainage pipes should be at least 12" (300 mm) to protect them from damage during sub-base or base compaction.

Installation guide
SEGMENTAL PERMEABLE PAVEMENT

04 SUB-BASE

For residential pedestrian applications, the sub-base may not be required and then only ASTM No. 57 (CSA 5-28) aggregate base layer with a minimum thickness of 6" (150 mm) can be used (use a thicker base for additional water storage). Refer to Base (see below 06).

When traffic load, soil conditions, and climate require greater than 12" (300 mm) of base or volume requirements for detention are higher, a sub-base may be required. Use sub-base ASTM No. 2 or No. 3 (CSA 40-80) meeting the following requirements:

- 90% fractured symmetrical particles
- Less than 5% passing the 200 sieve
- Industry hardness tested

A. Moisten, spread and compact the ASTM No. 2 (CSA 40-80) aggregate sub-base in minimum 6" (150 mm) lifts (without distorting or damaging the geotextile) according to the project specifications.

B. Make at least two passes in the vibratory mode followed by at least two passes in the static mode with a minimum 10 ton (9 metric ton) vibratory roller, until there is no visible movement of the aggregate. Alternately, a 13,500 lbf (60 kN) plate compactor can be used to compact the ASTM No. 2 (CSA 40-80) aggregate sub-base.

C. Do not allow the compactor to crush the aggregate.

D. Surface tolerance of the ASTM No. 2 (CSA 40-80) sub-base should be ± 2 ½" (64 mm) over 10' (3 m).

05 EDGE RESTRAINT

A. Install edge restraint according to project specifications.

B. Depending on the design, the top of the edge restraint can be hidden or exposed.

C. Install Avignon, Belgik, Pietra, Tundra or Universal edge units. Cast-in-place concrete or precast concrete curbs should be considered in vehicular use applications (commercial / industrial driveways, parking lots or streets).

D. Edge restraint may rest on an open-graded or dense-graded aggregate base.

06 BASE

A. Moisten, spread and compact the ASTM No. 57 (CSA 5-28) aggregate base layer in one 4" (100 mm) thick lift.

B. Make a minimum of two passes in vibratory mode followed by at least two in static mode with a minimum 10 ton (9 metric ton) vibratory roller, until there is no visible movement of the aggregate. Alternately, a 13,500 lbf (60 kN) plate compactor can be used to compact the ASTM No. 57 (CSA 5-28) aggregate base.

C. Do not allow the compactor to crush the aggregate.

D. Surface tolerance of the ASTM No. 57 (CSA 5-28) base should be ± 1" (25 mm) over 10' (3 m). Verify prior to setting bed installation.

07 BEDDING COURSE

A. Moisten, spread and screed the ASTM No. 8 (CSA 2.5-10) aggregate bedding layer in one 2" (50 mm) thick lift.

B. Surface tolerance of the ASTM No. 8 (CSA 2.5-10) bedding course should be ± ⅜" (10 mm) over 10' (3 m).

C. Construction equipment and pedestrian traffic on the screeded bedding course should not be permitted.

08 PAVER

A. Pavers should be placed in the pattern shown on the drawings. Lay units hand tight to designated laying patterns. Units have lugs to maintain consistent joint width.

B. In sloped conditions, it is preferable to start laying from the bottom in an uphill direction.

C. The minimum slope recommended for permeable pavement surface is 1%.

D. Inflo pavers can be installed with the TB100SI (Techo-Bloc mechanical tool) to expedite installation.

E. When subject to vehicular traffic, cut units should not be smaller than ⅓ of a whole paver. When using cut pieces, maintain joint.

F. In vehicular applications, pattern strength will increase if laying pattern is perpendicular to traffic flow.

Installation guide
SEGMENTAL PERMEABLE PAVEMENT

09 JOINT FILL

A. Fill the paver joint openings with ASTM No. 8 (CSA 2.5-10) aggregate (or No. 89, No. 9 depending on joint width). Sweep stone to fill joints. Surface must be swept clean prior to compaction.

B. Compact with a minimum 5,000 lbf (22 kN) plate compactor (two passes minimum). The installation of a neoprene pad is recommended to protect the texture of the paving units.

C. Do not compact within 6' (1.8 m) of unrestrained edges of the pavers.

D. Apply additional aggregate to fill the joint openings if needed and compact.

E. Surface tolerance of compacted pavers should be ± 3/8" (10 mm) over 10' (3 m).

APPROXIMATE MEASURES

Clean stone quantity in kg (lb) to cover an area of 1 m2 (1 pi^2) to fill between joints.
It is recommended to always start with a small area.

PRODUCTS	JOINT FILL MATERIAL	(lbs/sq. ft)	(kg/sq. m)
Antika	ASTM No. 8 (CSA 2.5 - 10) (1/4")	1.9	9.3
Blu 60 mm	ASTM No. 9 (CSA 2.5 - 5) (1/8")	0.7	3.2
Inflo	ASTM No. 8 (CSA 2.5 - 10) (1/4")	2.1	10.3
Mista random	ASTM No. 9 (CSA 2.5 - 5) (1/8")	1.0	5.0
Pure	ASTM No. 9 (CSA 2.5 - 5) (1/8")	1.4	7.0
Victorien 60 mm permeable	ASTM No. 9 (CSA 2.5 - 5) (1/8")	1.7	8.5
Villagio	ASTM No. 8 (CSA 2.5 - 10) (1/4") or ASTM No. 9 (CSA 2.5 - 5) (1/8")	2.1	10.2

Approximate quantity of clean stone required per sq. ft or sq. m

10 POST INSTALLATION PROTECTION

Prevent contamination of the porous (permeable) pavement system from fine aggregates and debris by maintaining erosion and sedimentation (E&S) measures at the perimeter.

Installation guide
SLABS

Installation outline

01 EXCAVATION

A. Before excavating, call all the local utility companies (e.g., phone, gas, electrical) to ensure that the area in which you plan to dig is clear of underground cables or wires. If any are found, please notify the appropriate companies before you continue.

B. When excavating, it is important to achieve a slope in increments of 3/16" per ft (5 mm per 300 mm) which will allow for proper drainage. The excavation should mirror final grade of pavement.

C. The width of the base behind the edge should be equivalent to the thickness of the base.

D. With the help of a rake, grade the bottom of the excavated area. If the natural soil is granular or sandy we recommend that you compact the soil with a vibrating plate. If the soil is clay-like, change the soil with a blend of lime and crushed stone priorto compaction. Next, cover it with a layer of geotextile membrane to prevent the contamination of the base (clay and 0-3/4" [0-20 mm] crushed stone). Refer to the table "**Thickness of the Granular Foundation**" (on next page) to find the minimum thickness of foundation required.

02 FOUNDATION

A. Install the 0-3/4" (0-20 mm) crushed stone base in 4" (100 mm) lifts with a minimum 5,000 lbf (22 kN) vibrating plate compactor.

B. To facilitate compacting, wet the base material thoroughly and compact with a vibrating plate proceeding in all directions. Continue this process until you achieve the desired height. At this stage, you can verify the final height with the help of a paver.

C. Base tolerance ± 3/8" (10 mm) for every 10' (3-m) increment.

03 THE SETTING BED

A. On the compacted crushed base, install two pipes with an outside diameter of 1" (25 mm). Grade the concrete sand with the help of a straight edge (or Quick-E leveler). If the base isn't properly graded and smooth, imperfections will be evident in the finishing grade of the pavement.

B. Once the setting bed is graded, pre-compact with a hand tamper, then lightly fluff.

04 INSTALLATION OF SLABS

A. Once the choice of slabs and the design have been finalized, it is recommended you start installing the slabs at a 90-degree angle. To obtain a 90-degree angle, use the rule of a 3 / 4 / 5-triangle. To do this, proceed as follows: measure a first horizontal line of 3' (1-m) and a second line of 4' (1.2 m) perpendicular to the first. Connect a third straight line of 5' (1.5 m), which will form a triangle, and the result will be a perfect 90-degree angle. While installing the slabs, walk on the installed slabs and fill in gaps caused by the pipes with concrete sand.

B. It is always recommended that you use more than two cubes at a time in order to maximize the colour blends. Furthermore, you should proceed with the cubes from top to bottom.

C. You may use a chalk line to mark the stones to be cut along the borders, using a concrete saw. When cutting slabs, we recommend you wear protective ear and eyewear.

D. Once you finish installing the slabs, you can then install Belgik, Pietra, Tundra, or Avignon curbstone. To keep curbs in place, add mortar along the back between the ground and the curbstone or, when available, use their plastic retention systems.

05 FILLING IN JOINTS

A. Spread out the polymer stabilizer sand on the slabs, and sweep in between joints in all directions.

B. Remove excess sand and follow the instructions exactly as indicated on the polymer stabilizer sand packaging.

C. The use of a vibrating plate is not recommended on slabs.

Installation guide
SLABS

VIBRATING PLATE ALERT!
We do not recommend passing the vibrating plate on slabs.

THICKNESS OF THE GRANULAR FOUNDATION[1]		
RESIDENTIAL PROJECTS	TYPE OF EXISTING SOIL	
	Clayey or Silty[2]	Sandy or Gravelly
Patios and Walkways	250 to 350 mm (10" to 14")	150 to 200 mm (6" to 8")

1. Data shown in this chart are provided as guidelines only. The range of values suggested depends particularly on existing soil conditions. The thicker the granular foundation, the greater the increase in stability of the whole structure.
2. In the case of unstable soils or ones particularly affected by the freeze-thaw cycles, a thicker foundation may be necessary. For soils with these conditions or for commercial, industrial, or institutional works, a geotechnical professional should be consulted.

QUANTITY CHART FOR JOINTS FILLING
Approximate surface coverage per 50 lbs (22.7 kg) polymeric sand bag.

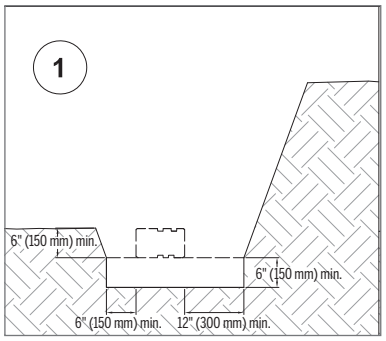
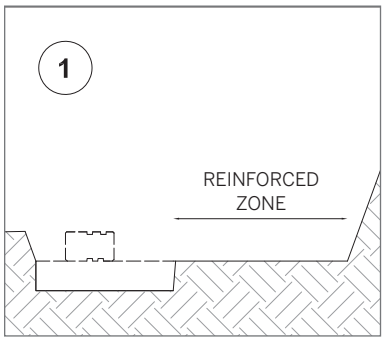
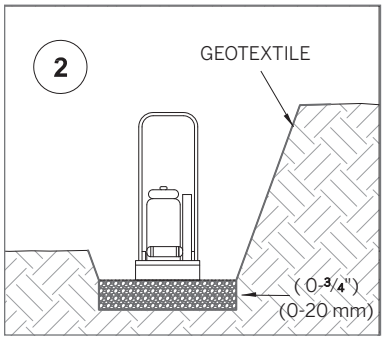
Installation guide
RETAINING WALLS

Installation outline







01 EXCAVATION

A. Check the location of existing structures and utilities before starting the excavation.

B. Dig out a trench. Its depth should be calculated according to the thickness of the leveling pad and the burial depth of the wall.

C. Plan for a thickness of at least 6" (150 mm) for the leveling pad and consider that at least 10% of the height of the wall should be buried in the ground. In all cases, the wall must be buried no less than 6" (150 mm) deep.

D. In determining the width of the trench, allow for a space of at least 6" (150 mm) at the front of the wall and 12" (300 mm) at the back for drainage fill. Compact and level the excavation base.

FOR GEOGRID REINFORCED RETAINING WALLS

The excavation must also take into account the legth of geogrid.

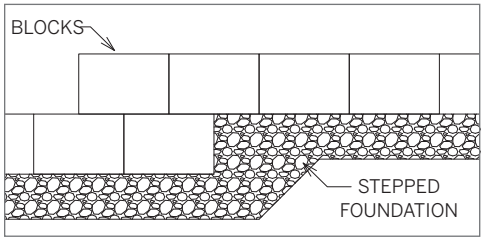
02 FOUNDATION

A. Cover the base and back of the trench with a geotextile. Extend the geotextile towards the back of the excavation and eventually above the drainage fill once it is in place close to the top of the wall.

B. Next, spread the 0-3/4" (0-20 mm) stone in the trench and compact using a vibratory plate or jumping jack, ensuring that the surface is level. The compacted leveling pad must be at least 6" (150 mm) thick.

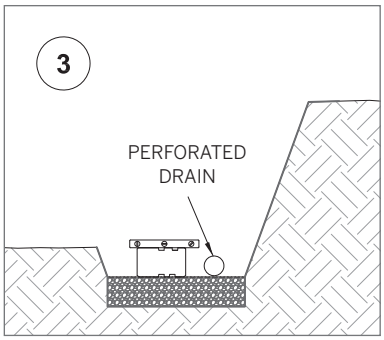
NOTE FOR STEPPED FOUNDATION

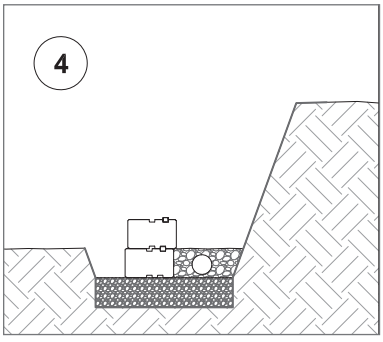
A wall built on an incline requires stepped foundations. For steep inclines, several steps may be required. Construction should start at the lowest level. Each of the steps must follow a level horizontal path and the vertical distance separating the successive steps must equal the height of a block.

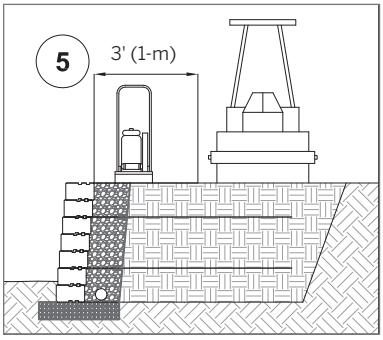


Installation guide

RETAINING WALLS







03 BUILDING THE FIRST COURSE

A. Using blocks of the same height, place the first course on the compacted leveling pad according to the predetermined layout. Check the alignment and leveling in all directions and make sure that all the blocks are in full contact with the leveling pad and properly supported.

B. Place the exposed surfaces of the blocks side by side. There must be no space between the exposed faces of adjacent blocks.

C. At the back of the wall and on the compacted leveling pad, lay a 4" (100 mm) diameter perforated drain. Connect this drain to the existing drainage system so that it clears the water accumulated behind the wall.

04 BACKFILLING

Backfill at the rear of the wall and the space between the back of the blocks with ¾" (20 mm) clean stone. Level and settle the clean stone. Any cavities in the blocks must also be filled with clean stone.

05 SUBSEQUENT COURSES

A. Clean the top of each block before laying the next course. Depending on the type of block, install the connectors on the extremity of each block.

B. Lay the subsequent courses, backfilling at the rear of the wall every 8" (200 mm maximum, using the same method outlined in step 4.

C. Make sure the subsequent courses are laid such that the vertical seams are aligned with the blocks below.

FOR GEOGRID REINFORCED RETAINING WALLS

Where geogrids are to be used, cover the clean stone with a geotextile. Select the geogrid according to the type, level and appropriate length. Position the geogrid according to the main reinforcement direction perpendicular to the wall. The geogrid must be continuous all along its embedment length. Splicing of the geogrid in the main reinforcement direction is not permitted. The geogrid must be installed horizontally over the compacted backfill and the previous course of blocks. Fix the connectors on the geogrid and lay the next course of blocks. Pull on the back of the geogrid and maintain its tension by stakes or pins. Repeat with a new section of geotextile and place the reinforced backfill directly behind the drainage fill. Fill and compact up to the level of the blocks.

Heavy equipment must not be used less than 3' (1-m) behind the blocks. Construction equipment must not drive directly over the geogrid.

Repeat the various installation steps.

06 FINISHING

Position the course of coping stones (if applicable) or the final course of blocks to complete the wall. The coping stones or final course of blocks must be fixed to the subjacent blocks using concrete adhesive and there must be no space between the blocks.

For more information, refer to the Wall Design Charts on page 175.

Installation guide
MONUMENTAL RETAINING WALL

General note

Segmental retaining wall blocks are enormously popular today, so much so that a 24' (7-m) high wall supporting a 1,000 psf (48 kPa) load is no longer considered to be a reinforced concrete application. Techo-Bloc's Monumental is granite-like in appearance and suits high wall applications very well. The base block and regular unit allow versatile applications and offer superior structural strength. The units have tapered sidewalls, allowing interior and exterior curves. When incorporating the built-in 11-degree batter under the right soil conditions, walls as high as 10' (3-m) can be achieved without the use of geogrid. The appearance of the Monumental will enhance any environment and soften the image of an industrial facility.

Monumental requires mechanical installation, greatly reducing installation time and avoiding manual labor. Lifting the Monumental units with excavation equipment already on-site for earthwork reduces crew downtime. With its large profile when placed in a running bond stacking pattern, the Monumental brings back the natural carved beauty of a quarried stone.

IMPORTANT

The technical guidelines provided by Techo-Bloc are consistent with industry standards in general and NCMA design methodology and guidelines. Global stability of the wall being built should be addressed by the site designer or project geotechnical engineer. The correct application of any design is the responsibility of the user and should be verified by an engineer. A local wall designer should engineer all retaining walls for site-specific conditions.

For safety during construction a safety rail or net must be installed securely onto the Monumental wall for the fall protection of the wall installers. When building a Monumental wall over five feet all persons working around the perimeter of the wall must be securely harnessed.

It should be noted that all suggestions and recommendations by Techo-Bloc are based on general industry instructions, and should not be interpreted as constituting an engineer's specifications.

Installation outline

01 INSPECTION AND PREPARATION

A. Plan and execute the project according to the drawings and specifications prepared by the engineer.

B. Notify the engineer of site conditions that may affect wall performance, soil conditions observed other than those assumed, or other conditions that may require a reevaluation of the wall design.

C. Verify the location of existing structures and utilities prior to excavation.

D. Ensure surrounding structures and buried utilities are protected from the effects of wall excavation. Embankment support, if required, including stability of the excavation area, are the responsibility of the contractor.

Installation guide
MONUMENTAL RETAINING WALL

02 EXCAVATION AND FOUNDATION PREPARATION

A. Excavate the native soil to the lines and grades specified on the site grading plans. After the excavation, the native soil must be inspected by an engineer in order to ensure that the soil's bearing capacity is in keeping with specifications. Use care in excavating to prevent disturbance of the sub-grade beyond the lines specified by the engineer.

B. Beginning at the lowest elevation point of the Monumental wall, excavate a trench at least 40" (1-m) wide for the regular Monumental unit or 54" (1.35 m) wide for the Monumental Base unit down the length of the wall that will accommodate at least all of the leveling pad and 8" minimum (200 mm) of block embedment. Fill over excavated areas with suitable compacted backfill, as recommended by the engineer.

03 LEVELING PAD PREPARATION

A. Before laying the leveling pad material, it is recommended that you install a geotextile membrane along the bottom and banks of the trench to prevent the contamination of soil and leveling pad.

B. Place leveling pad material to the depths and widths shown on specifications.

C. Extend the leveling pad laterally at least 7" (175 mm) in front and 12" (300 mm) behind the lowermost Monumental retaining wall unit.

D. The leveling pad should have a minimum thickness of 8" (200 mm) and should be installed in 6" (150 mm) thick layers and compacted to 98 percent Standard Proctor or according to project specifications. The leveling pad should be composed of 0-$^{3}/_{4}$" (0-20 mm) granular material.

E. Compact granular leveling pad material to provide a level, hard surface on which to place the first course of Monumental units.

F. Prepare leveling pad material to ensure complete contact with bottom of all Monumental retaining wall base units installed. Gaps are not tolerated.

GEOTEXTILE AND COMPACTION

LEVELING PAD AFTER COMPACTION

LEVELING EACH UNIT

04 WALL CONSTRUCTION

A. The Monumental Wall unit has a unique lifting system. Techo-Bloc has developed a driving anchor for lifting and positioning Monumental. Attach a chain or sling securely to the Monumental-lifting anchor provided by Techo-Bloc and insert the Monumental-lifting anchor into the opening on the top of the block. Turn the Monumental-lifting anchor 90-degrees to lock the Monumental into place. Lift the Monumental up securely and place into the desired area. Stand clear of the Monumental while it is suspended in the air for safety reasons.

B. Select the "U" insert for building an 11° batter wall, or the "Z" insert to build a near vertical wall. Make sure you inform your local dealer when building a vertical wall, since only the "U" insert is standard.

Installation guide
MONUMENTAL RETAINING WALL

INSTALLING THE FIRST COURSE

CLEANING DEBRIS OFF UNITS

C. Install the first course of base block on the prepared leveling pad. Make sure all units are level and aligned correctly. Use a string line measured from the back of the block to set your alignment.

D. Place the drainage aggregate in 8" (200 mm) lift and a minimum 12" (300 mm) directly behind and in the Monumental wall units. Fill in the voids of the Monumental units with drainage aggregate. Cap the backfill and drainage aggregate zone with 8" (200 mm) of impervious material.

E. Install a perforated PVC drainage pipe 4" (100 mm) in diameter. Slope the main collection drainage pipe, located just behind the Monumental units ¼" per ft (6 mm per 300 mm), this will give you a 2% slope and provide gravity flow to the daylighted areas. You can also connect the drainage pipe to a storm sewer system at 50' (15-m) maximum interval.

INSTALLING THE FIRST COURSE

F. For inclined (11˚) walls, you will use the "U" connector and a "Z" connector for near vertical walls. Place the connectors as recommended by the manufacturer. When geogrid is required, the insert must be installed above the geogrid so that it gets wedged into the slots.

G. Check each course for level and alignment. Prior to adding successive courses, the top of each Monumental needs to be cleaned free of foreign material.

H. Repeat this process for each successive course. Large compaction or construction equipment should be kept more than 3' (1-m) away from the back of the wall. This 3' (1-m) area should be compacted with a vibrating plate compactor.

05 MULTI-LEVEL OR STEPPED BASE WALL

When building a multi-level Monumental wall, each level must be constructed according to rigorous standards.

A. Separate the elevation into individual landings as per engineer's specifications and consistent with the height of Monumental.

B. When calculating the landing, take into account the drop value of the height of the Monumental wall.

C. Step the units accordingly in order to maintain the required embedment.

D. Maintain running bond joint pattern so that vertical joints are staggered between courses.

E. Use the Monumental regular to maximize bridging between steps.

06 INSTALLATION OF GEOGRID (IF REQUIRED)

Geogrids should be installed according to manufacturers' recommendations.

A. Orient the geogrid with the highest strength axis perpendicular to the wall face.

B. Prior to geogrid placement, pour the backfill and compact to the elevation of the top of the wall units according to the degree of compacting specified by the engineer. For compacting immediately behind the wall face, see section 4-H.

C. Install appropriate geogrid strength at the proper elevations and to the lengths specified on the wall design.

Installation guide
MONUMENTAL RETAINING WALL

D. Lay the geogrid horizontally on top of the Monumental wall units and the compacted backfill soils. Place the geogrid within two inches of the face of the Monumental wall units. Install the inserts and lay the next course of Monumental wall units on top of the geogrid.

INSTALLING GEOGRID HORIZONTALLY

TENSIONING GEOGRID

E. The geogrid must be pulled taut and free of wrinkles before backfilling the retaining wall. In order to do so, pull the geogrid hand-taut and secure the ends with staples, stakes, or by hand tensioning the geogrid until it is covered by 6" (150 mm) of loose fill.

F. The geogrid must be continuous throughout its embedment lengths. Splices in the geogrid strength direction are not tolerated.

07 BACKFILL PLACEMENT

A. Pour backfill at the back of the wall and compact to minimize any geogrid relaxation.

B. Place fill within the reinforced zone and compact in lifts not exceeding 6" (150 mm) (loose thickness) where hand-operated compaction equipment is used, and not exceeding 10" (250 mm) (loose thickness) where heavy, self-propelled compaction equipment is used.

Note: Only lightweight hand-operated compaction equipment is permitted to operate within less than 3' (1-m) of the back of the Monumental wall units. If the specified compaction level cannot be achieved within 3' (1-m) of the back of the Monumental wall units, replace the reinforced soil in this zone with drainage aggregate material.

C. Minimum compaction requirements for fill placed in the reinforced zone:

Walls less than 15' (4.5 m) high – Compact to 95% of the soil's Standard Proctor maximum dry density (ASTM D698) or modified Proctor (ASTM D1557) for the entire wall height, as indicated by the engineer.

Walls over 15' (4.5 m) high **but not more than 30' (9-m) high** – Change compaction requirements to 98% of the soil's Standard Proctor or modified Proctor (ASTM D1557) maximum dry density (ASTM D698) for the entire height up to 30' (9-m), as indicated by the engineer.

Walls over 30' (9-m) high – Change compaction requirements to 100% of the soil's Standard Proctor maximum dry density (ASTM D698) or modified Proctor (ASTM D1557) for the entire wall height, as indicated by the engineer.

D. Utility trench backfill: Compact utility trench backfill in or below the reinforced soil zone to the same requirements as the wall height, as indicated by the engineer.

Note: Utilities must be properly designed (engineered) to withstand all forces from the Monumental wall units, reinforced soil mass, and surcharge load, if any.

E. Moisture content: Soil shall be moisture conditioned before placement to within two percentage points of the optimum moisture content for all wall heights.

F. These specifications may be changed based on recommendations by the engineer.

G. At the end of each day's operation, slope the last level of compacted backfill to direct surface water runoff away from the wall face. The general / earthwork contractor is responsible for ensuring that the site drainage during construction is directed away from the Monumental wall until permanent site drainage features are operational.

08 CAP UNIT INSTALLATION

A. Apply a concrete adhesive to the top of the cleaned surface of the unit below and place the Monumental cap unit into the desired position.

B. If necessary, cut the Monumental cap units to obtain the proper fit.

C. Backfill and compact to top of the Monumental cap unit.

Installation guide
MONUMENTAL RETAINING WALL

09 CURVE / CORNER INSTALLATION

CONVEX AND CONCAVE CURVES

A. Place the Monumental units on the leveling pad such that there are no gaps between the two faces of the Monumental Units used.

B. When building multiple courses on a curve, begin installation by placing a Monumental in the middle of the curve, centering on two Monumental blocks directly below it.

C. Place the Monumental units side by side from the center block outward along the curve.

D. Place the Monumental caps and measure the distance of the gap between the caps. Using this measurement, cut the Monumental cap so it is parallel with the adjacent Monumental cap unit.

E. Slide the Monumental cap in its place so that it is flush with the adjacent Monumental cap unit.

F. The minimal radius obtained with the Monumental is 17' (5.2 m).

OUTSIDE 90-DEGREE CORNER

A. When building a Monumental wall with an outside 90-degree corner, it is recommended that the construction of the Monumental wall start at the corner desired and continue working away from this point in both directions. The placement of the Monumental corner blocks will allow a normal batter consistency in both wall directions.

B. One standard Monumental corner block will be used at the corner of each course of the wall. The Monumental corner blocks will overlap each other at the corner, coming together in a "zipper fashion". The Monumental corner blocks should be glued at the corner where they overlap with a concrete adhesive.

INSIDE 90-DEGREE CORNER

When building a Monumental wall with an inside 90-degree corner, it is recommended that you start each subsequent course at the corner and lay out block from that corner.

FENCING / GUARDRAILS

Guardrails and handrails should be installed behind the Monumental in the soil. It is possible to install fencing at the top of the Monumental wall by core drilling into the top of the Monumental. Follow the instructions of the railing manufacturer and wall design engineer. It is, however, recommended that if the fencing is to be installed at the top of the wall, the top two rows of Monumental should be glued to the rows of Monumental Blok beneath it with a concrete adhesive.

10 GEOGRID INSTALLATION IN A CURVE / CORNER APPLICATION

CONVEX CURVE

A. Place geogrid perpendicular to wall face at center of geogrid. Trim the geogrid to fit onto the curved face of the wall and place the geogrid with the curve to follow its contour.

B. Overlapping layers of geogrid on a convex curve requires a minimum of 3" (75 mm) of soil between them for proper anchoring. Repeat for successive specified geogrid layers.

C. Install the geogrid to the length specified by the wall designer.

Installation guide
MONUMENTAL RETAINING WALL

CONCAVE CURVE

A. The strength direction of the geogrid must be placed perpendicular to the wall face. Align the cut geogrid sections so that they follow the contour of the concave curve. Geogrid layers should not overlap. A wall designer should specify the desired length of geogrid.

B. The next successive geogrid layer must be placed to cover the area of reinforced soil below. This will maximize lapping. Repeat these steps for successive specified geogrid layers.

OUTSIDE 90-DEGREE CORNER

To insure proper anchorage, it is important that geogrid layers that overlap on an outside 90-degree corner are covered by 3" (75 mm) of soil. Repeat for successive specified geogrid layers.

11 FINAL TOUCH

When prelaying the last course of Monumental and capstones, overlap the geotextile towards the wall, totally covering the 0-3/4" (0-20 mm) clear crushed stone (drainage material). Use impervious soil to cover the drainage stone and remainder of the back fill. The soil cap must be manually compacted and it is recommended that a swale be created in order to channel water off the top of the wall. For all other applications, such as concrete or asphalt situated behind the wall it is a requirement that you compact 2' (600 mm) behind the Monumental wall with a lightweight compacting plate at 6" (150 mm) intervals.

[1] The maximum wall height recommended in this table is based on the following conditions:

- The retained soil type considered is gravel with an internal friction angle of at least 36°.
- There is no surcharge load applied on top of the wall.
- There is no slope on top of the wall.
- An adequate drainage system is provided at the back of the wall.

[2] These products can be used with geogrid reinforcement to build higher (inclined) walls or walls subject to different conditions than those mentioned.

Contact your Techo-Bloc representative for more details or fill out our Preliminary Design Assistance form (see page 173).

[3] Minimum wall radius is measured at the front face of the wall. It corresponds to the lowest course in an internal curve and to the uppermost course in an external curve (see page 197).

Retaining Wall design Charts

PRELIMINARY DESIGN ASSISTANCE

Techo-Bloc can help you in your preliminary design of retaining walls which fall outside the bounds of the Height Charts. However, preliminary design should only be used to assess the suitability of a wall system to a specific project or for estimating budget costs. For final construction designs, please contact a qualified engineer in your area.

Typical cross section

The information contained in the design charts is supplied for information purposes only and as such should only be used forpreliminary designs. A qualified engineer should be consulted for the final design to be used for construction. TECHO-BLOC and its predecessors, successors, beneficiaries, employees, associates, administrators and insurers can not under any circumstances be held liable for the incorrect use of information contained in the design charts.

The design charts show the number, position and length of the geogrids for a Techo-Bloc inclined wall based on the height of the wall and the load conditions. Furthermore, geogrid may be required for walls with a height lower than the minimum stated. The geogrid layout has been optimized to satisfy the minimum design requirements of the "Design Manual for Segmental Retaining Walls, 3rd Edition" from the National Concrete Masonry Association.

The height (H) of the wall is the total height from the leveling pad to the top of the wall including the coping stones of 75 mm (2.95 in) thick; 100 mm (3.94 in) for Monumental wall. The wall height varies approximately from 0.6 m (1.97 ft) to 2.5 m (8.20 ft), gradually increasing in height increments of 0.4-0.8 m (1.31-2.62 ft). The type of soil assumed in the reinforced soil zone (reinforced backfill) is a mixture of sand and gravel (minimum friction angle of 36°). The description of the soil is provided for information purposes; it is the actual shear strength parameter that will govern the design.

THE TWO LOAD CONDITIONS ARE:

(i) A horizontal surface above the wall with a surcharge of 6 kPa (125 psf).

(ii) A 1V:3H slope above the wall.

The —(XXX) symbol shows the position and length of the geogrid taken from the front of the block. The height of the wall and the length of the geogrid are given in millimeters.

The foundation soil must be able to support the wall-reinforced backfill system. A geotechnical study to ascertain the bearing capacity of the soil must be carried out. The leveling pad is made of 0-20 mm (0-3/4 in) crushed stone. A concrete pad can be used. Compaction must be carried out in successive layers of a maximum of 8 in (200 mm) in thickness and in accordance with project specifications. The minimum burial depth must be 200 mm (8 in) or 10% of the above ground wall height, whichever is greater.

E. EMBEDMENT DEPTH
Largest: 8" (200 mm) or 10% of the height above ground Min.
F. TOTAL HEIGHT (VARIABLE)
G. TOPSOIL
H. LOW PERMEABILITY SOIL
I. CLEAN STONE ¾" (20 mm)
12" (300 mm) MIN. BEHIND WALL
J. GEOTEXTILE
K. PERFORATED DRAIN 4" (100 mm) ø
L. LEVELING PAD
CRUSHED STONE 0-¾" (0.-20 mm) COMPACTED

The information contained in the design charts is supplied for information purposes only and as such should only be used for preliminary designs. A qualified engineer should be consulted for the final design to be used for construction. TECHO-BLOC and its predecessors, successors, beneficiaries, employees, associates, administrators and insurers can not under any circumstances be held liable for the incorrect use of information contained in design charts.

The design charts are graphically presented to show different configurations of Monumental gravity-wall (geogrid is not required) at the setback position (3" (76 mm) setback per block course) and near vertical position (⅜" (10 mm) setback per block course). Monumental walls can be made of uniform depth block units (either regular or base units). However, in some cases, for economics and speed of construction, regular and base block units are combined. The design charts on the following pages cover the scenarios of walls with uniform and combined depth block units. Each configuration was optimized to meet the minimum design requirements as prescribed in the NCMA Design Manual for Segmental Retaining Walls, 3rd Edition.

The height (H) of the wall is the total height from the leveling pad to the top of the wall including the Monumental cap unit of 3.94" (100 mm) thick. The wall height ranges from 1.64' (0.5 m) to 10.83' (3.3 m), increasing in height incrementally by 1.31' (0.4 m).

THE THREE TYPES OF RETAINED SOIL ASSUMED ARE:

(i) sand and gravel mixes (friction angle of 36° min.);

(ii) sands (friction angle of 30° min.);

(iii) low plastic silts and clays (friction angle of 28° min.).

The soil descriptions are provided only as a general guide and it is the actual shear strength parameter that will govern the design. The assumed moist unit weight of soils is 125 pcf (19.6 kN/m³).

Wall Design Charts

RETAINING WALL - MONUMENTAL

THE FOUR LOAD CONDITIONS ASSUMED ARE:

(i) a horizontal surface above the wall with no surcharge;

(ii) a horizontal surface above the wall with a uniform surcharge of 100 psf (4.8 kPa);

(iii) a horizontal surface above the wall with a uniform surcharge of 250 psf (12 kPa);

(iv) a 1V:3H slope above the wall.

The foundation soil must be able to support the wall. A geotechnical study to ascertain the bearing capacity of the soil must be carried out. The leveling pad is made of crushed stone 0-3/4" (0-20 mm). A concrete leveling pad can also be used. Compaction must be carried out in successive layers of a maximum of 8" (200 mm) in thickness and in accordance with project specifications. The minimum burial depth must be 8" (200 mm) or 10% of the above ground wall height, whichever is greater.

For further information, please contact our technical service department.

- The hydrostatic pressure is not considered. The wall must be provided with an adequate drainage system.
- Surcharge of 250 psf (12 kPa) (trucks).
- Surcharge of 100 psf (4.8 kPa) (cars).
- The design charts do not apply to tiered walls.

For further information, please contact our technical service department.

Installation guide
RETAINING WALLS

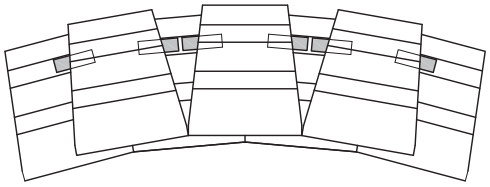
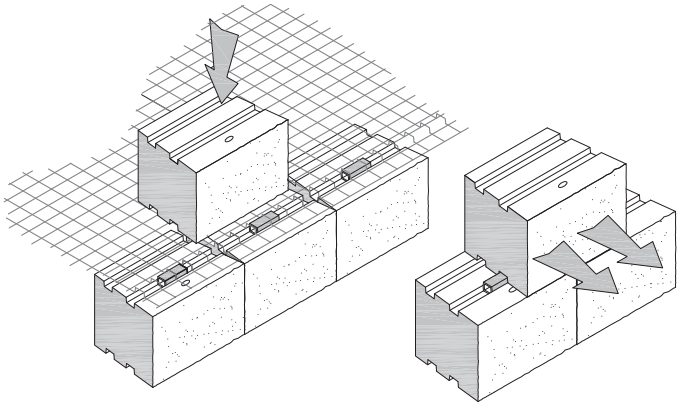
Anchoring system | Connectors in curved wall application

When creating internal curves and the connectors are in the back groove, two connectors must be installed on each block as illustrated.

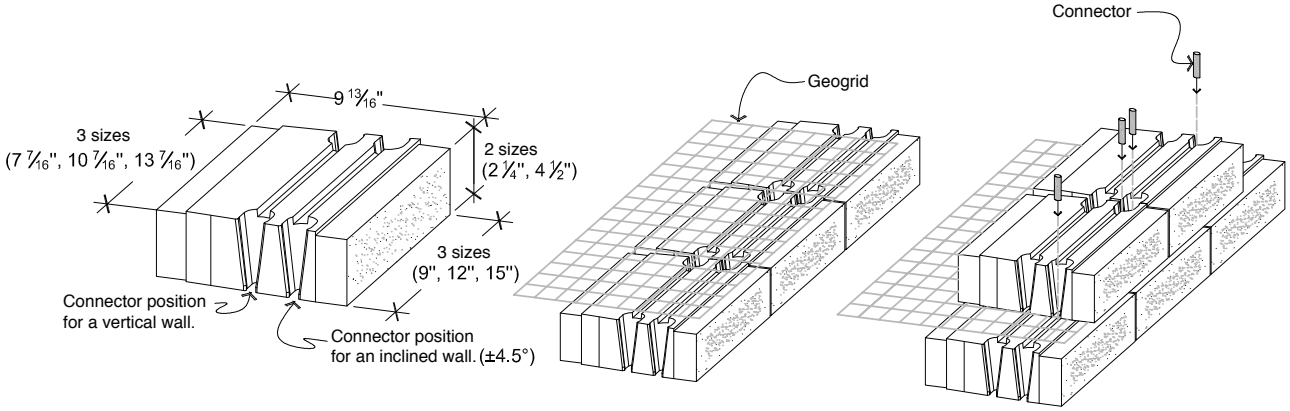


Anchoring system | Connectors in geogrid reinforced wall application

When using a geogrid, it must be placed above the connectors. The connectors will therefore be placed before the geogrid. After positioning the geogrid, move the block (from the above course) forward until it touches the connectors and ensures that the system is locked.



PRESCOTT BLOCKS

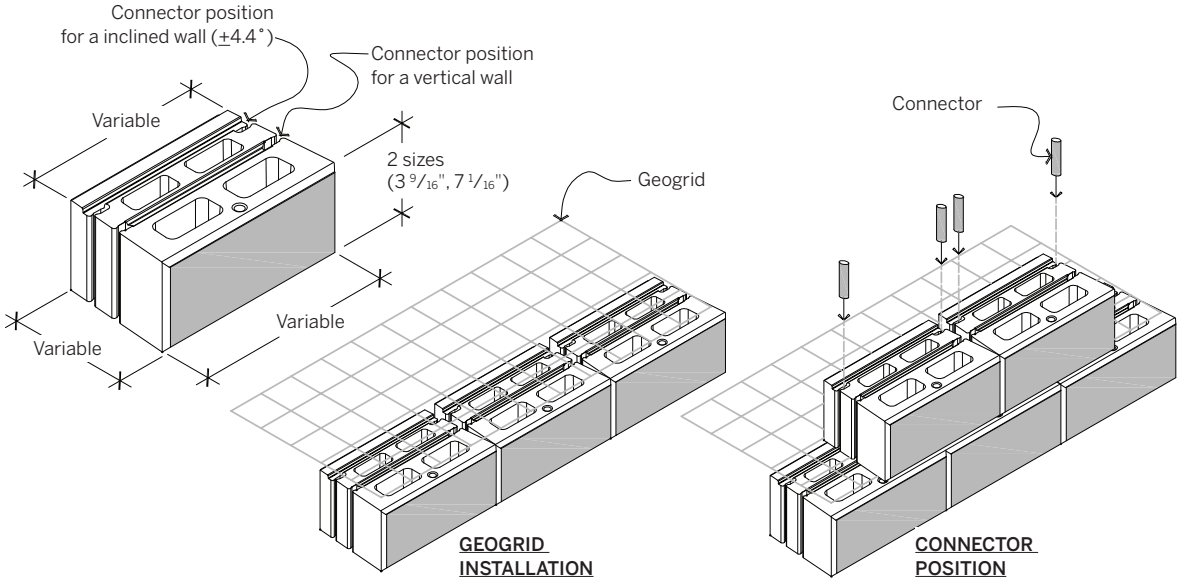


GEOGRID INSTALLATION CONNECTOR POSITION

Note: It is recommanded to install the connectors for an inclined wall when a geogrid is required.

Installation guide
RETAINING WALLS

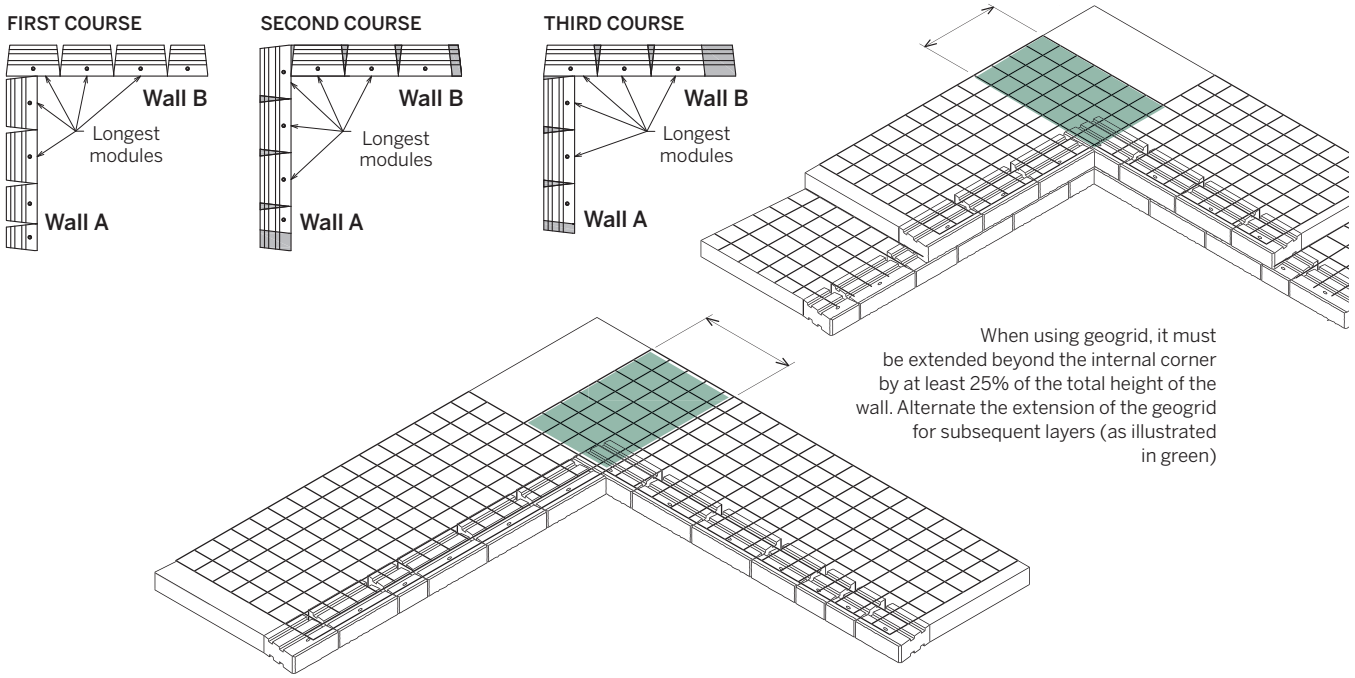
BRANDON & RAFFINATO BLOCKS



NOTE: It is recommanded to install the connectors for an inclined wall when a geogrid is required.

Internal corner

When building a wall with an internal corner, it is recommended to start constructing the wall at the corner and build out from this point in both directions. To form the corner, use the longer modules as illustrated. Build wall B by extending it out from wall A so the end of wall B is aligned with the back of wall A. For subsequent courses, simply alternate the extension of walls A and B.

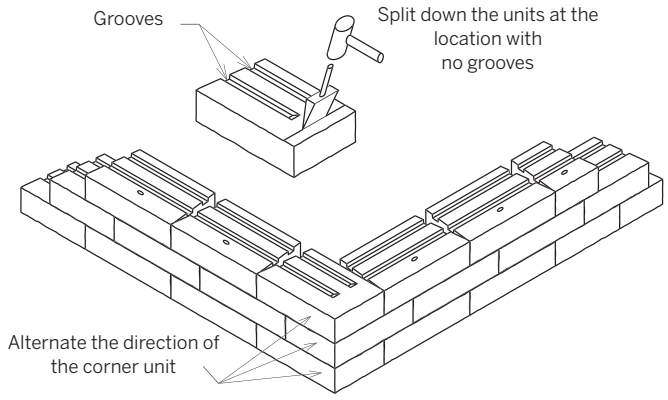


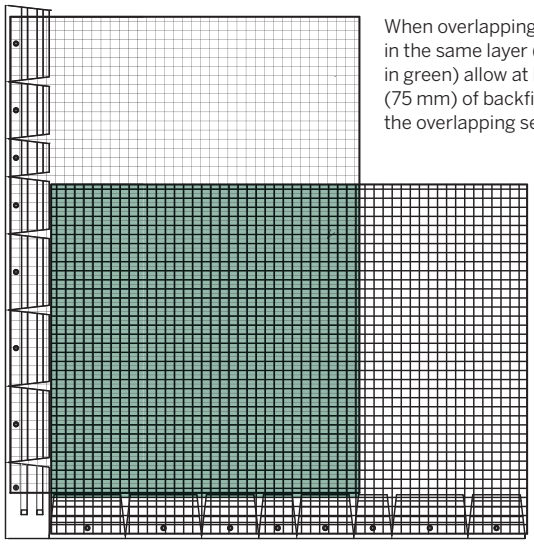
When using geogrid, it must be extended beyond the internal corner by at least 25% of the total height of the wall. Alternate the extension of the geogrid for subsequent layers (as illustrated in green)

Installation guide
RETAINING WALLS

External corner

For walls with an external corner, start building the wall from the corner and continue from this point in both directions. Each pallet contains units that can be used to make a corner. On-site, these units (except the Suprema blocks) must be split down the side using a hammer and chisel in order to obtain a corner unit. For each subsequent course, alternate the direction of the corner unit and secure the corner unit to the block below using concrete adhesive.

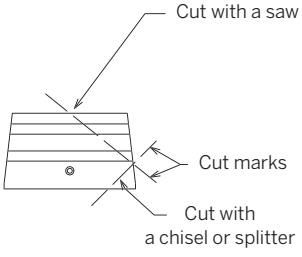


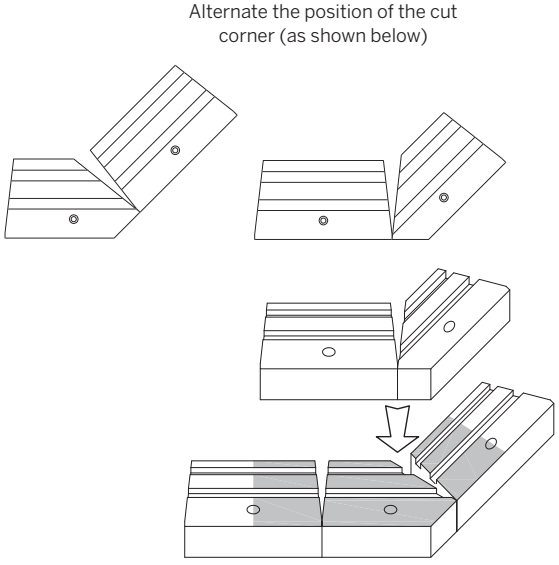


When overlapping two geodrids in the same layer (as illustrated in green) allow at least 3" (75 mm) of backfill in between the overlapping section

Oblique corner

The longer modules should be used to build an oblique external corner. Cut the non-exposed part of the block using a saw. Use a chisel or splitter to give the exposed face of the block a textured look. Alternate the cutting of the blocks for each subsequent course.



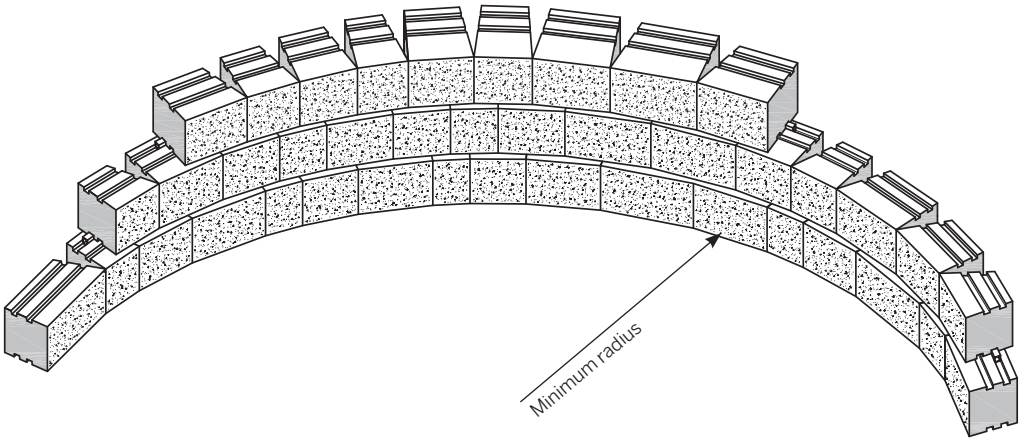


Installation guide
RETAINING WALLS

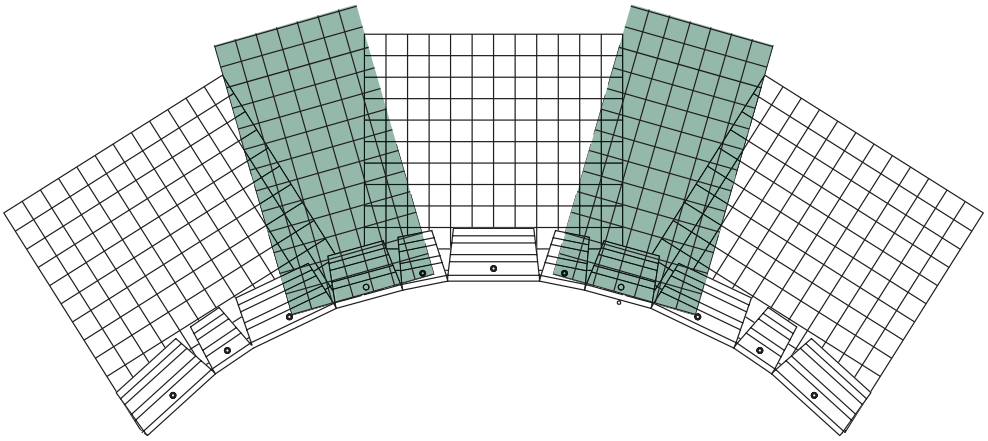
Internal curve

The Techo-Bloc retaining wall system allows walls to be built with internal and external curves. These curves can be achieved without cutting the blocks. You will need to angle the curves according to the minimum radius specified by Techo-Bloc.

When building a wall with an internal curve, it is recommended to start building the wall at the center of the curve and place blocks alternately to the left and right of the central block. If the wall to be constructed requires a setback (inclined wall),each course should be offset to the back and the curve will then become bigger. The minimum radius is therefore that of the first course.



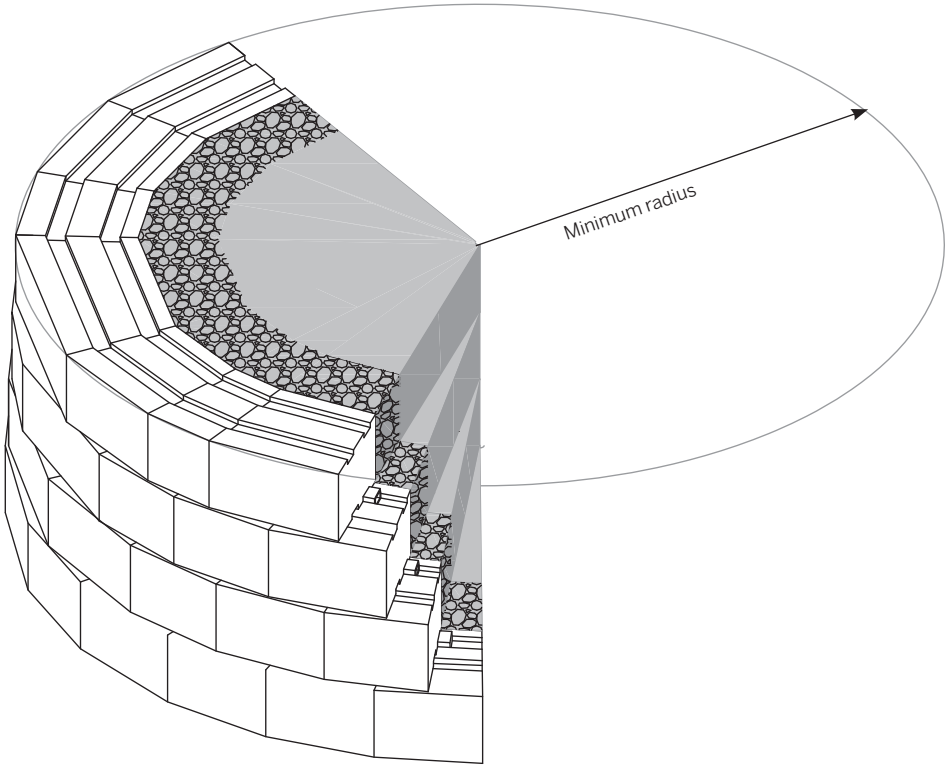
When using geogrid, it must cover 100% of the surface around the curve. To do this, additional layers of geogrid are placed on the next course of blocks to fill voids created from previous course (as illustrated in green).



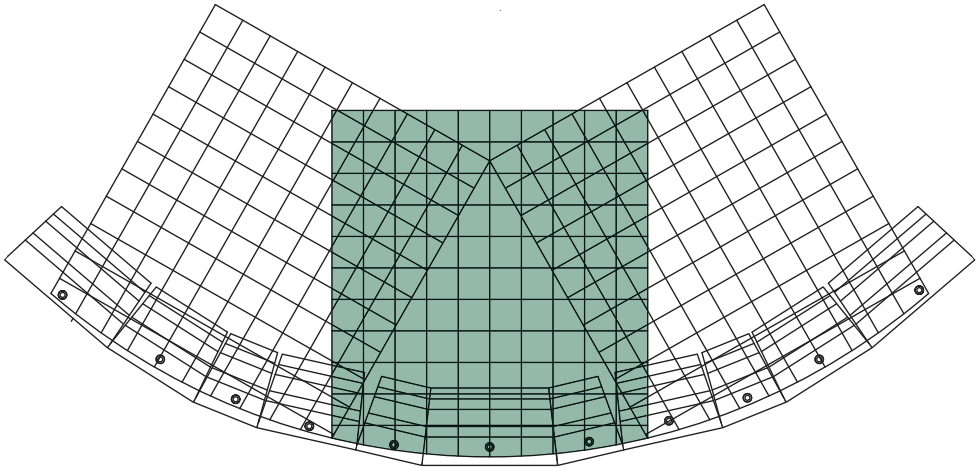
Installation guide
RETAINING WALLS

External curve

When building a wall with an external curve, it is recommended to start building the wall at the center of the curve and place blocks alternately to the left and right of the central block. Unlike internal curves, the external curve gets smaller as courses are added. The minimum radius is therefore that of the last course.



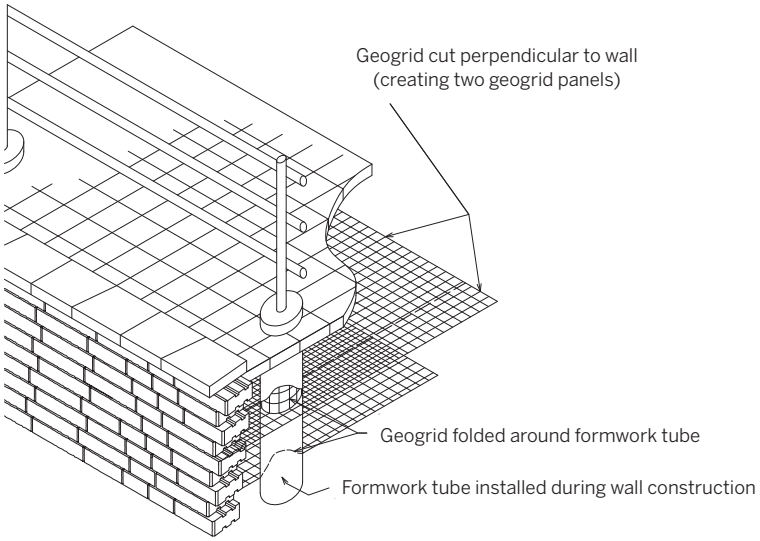
When using geogrid, it must cover 100% of the surface around the curve. To achieve this, additional layers of geogrid are placed on the same course of blocks to fill voids (as illustrated in green). In this case, we recommend at least 3" (75 mm) of backfill in between the overlapping sections.



Installation guide
RETAINING WALLS

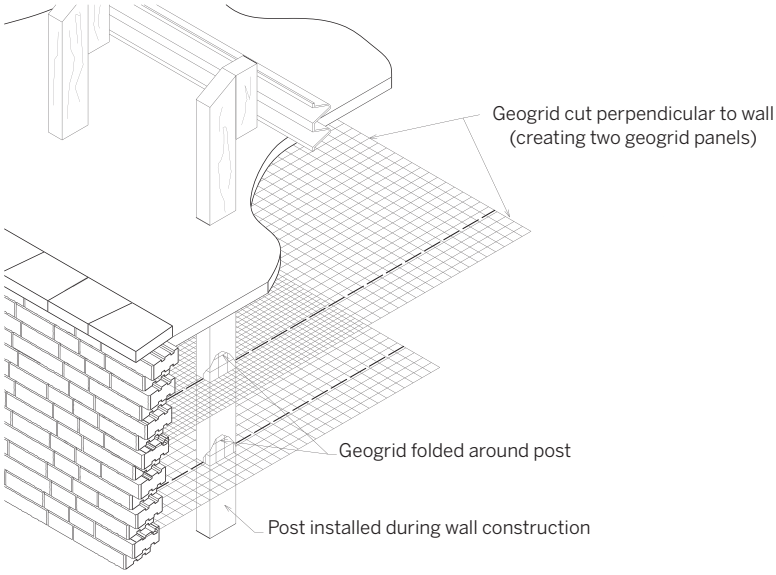
Fencing

Fencing can be erected behind the blocks. Fence posts must be placed in formwork tubes positioned during construction of the wall and then filled with concrete. The geogrid may be cut to accommodate installation of the tubes. Cut the geogrid in alignment with the center of the formwork tube and perpendicular to the wall, thus creating two geogrid panels. Connect the two geogrid panels at the front and back of the formwork tube and bend the geogrid to fit around the formwork.



Guard Rail

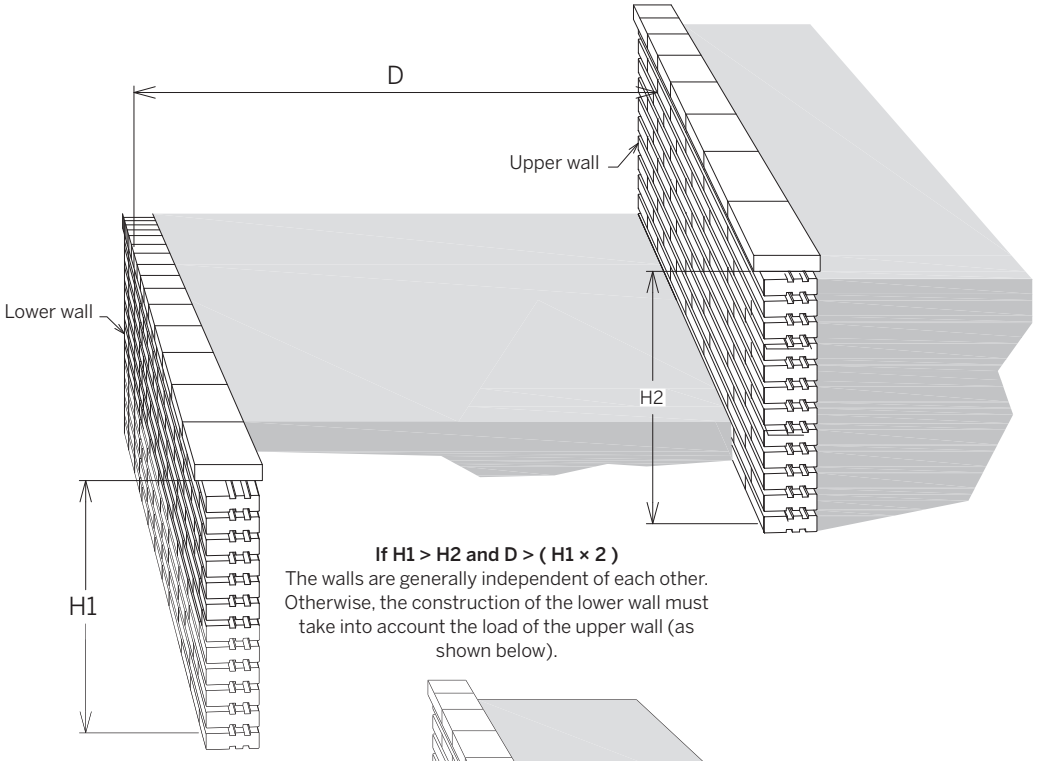
As with fencing, a guardrail can be incorporated behind the blocks. The guardrail posts must be installed during construction of the wall. The geogrid is cut perpendicular to the wall and in alignment with the center of the post, thus creating two geogrid panels. These two panels are connected at the front and back of the post. The geogrid can be bent to fit around the post.



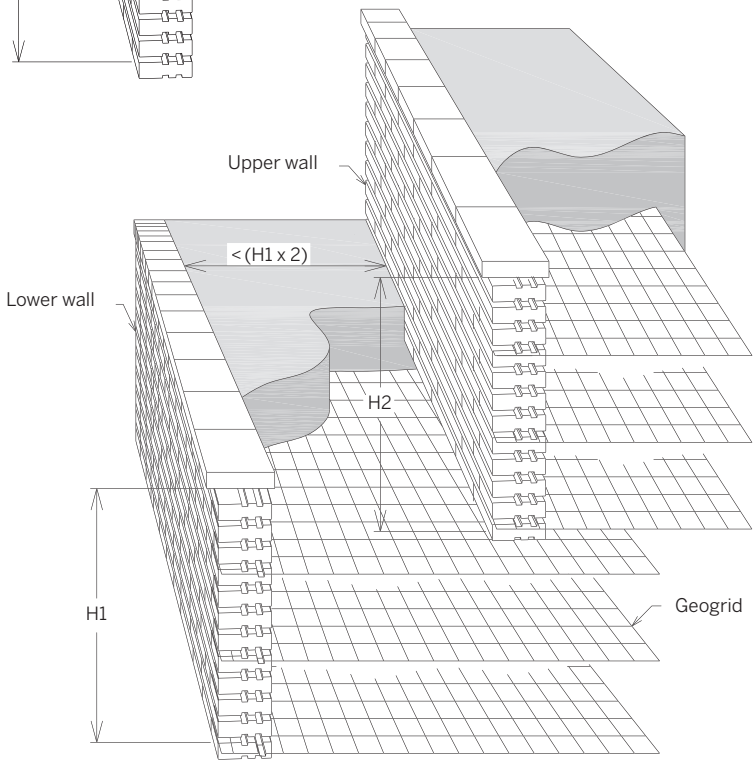
Installation guide
RETAINING WALLS

Tiered wall

Although tiered walls look appealing, it is important to take into account the additional load the upper wall applies on the lower wall. If the distance between the walls is at least twice the height of the lower wall, the walls are generally independent of each other. However, if this distance is less, the lower wall must be built to take account of the load of the upper wall and geogrids may be required.



If H1 > H2 and D > (H1 × 2)
The walls are generally independent of each other. Otherwise, the construction of the lower wall must take into account the load of the upper wall (as shown below).



Installation guide

LAYING PATTERNS FOR RETAINING WALL

Techo-Bloc has developed a series of patterns to inspire you and help create your retaining wall projects and include the following products: (Baltimore, Mini-Creta, Prescott and Raffinato). The patterns are created from various models.

Each model provides the possibility of different combinations of modules. A combination can be repeated several times or combined to create a variety of combinations. Depending on the height of the wall or, if the geogrid is used, a combination of different patterns may be used for the same wall.

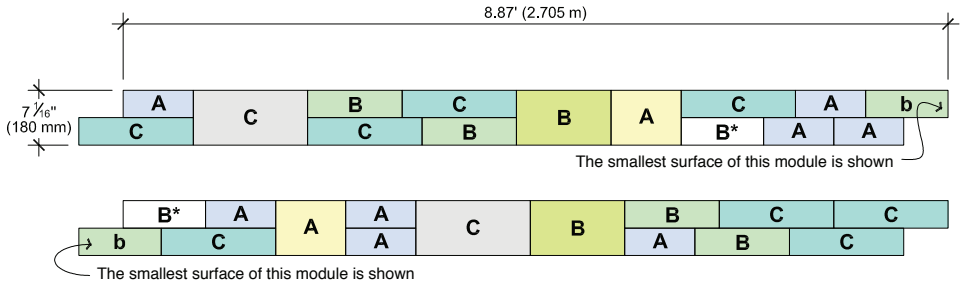
These patterns have been developed to capture the look of hand-laid stone. For each pattern, a ratio of quantity is provided, which will guide you in estimating the overall material required for a given project.

WALLS - BALTIMORE 90 mm & 180 mm

1-row pattern | Laying patterns

The single row model shows two examples of combinations without the B* module of the Baltimore 180 mm and two examples of combinations without the B module of the Baltimore 180 mm. Each combination is 180 mm long (7 1/16") high. **This model can be used for installing the last row of modules or where other models cannot be used.**

COMBINATIONS WITHOUT THE B * MODULE OF THE BALTIMORE 180 mm:



NUMBER OF BLOCKS REQUIRED	MODULE			
BALTIMORE	**A**	**B**	**B***	**C**
67% of the surface - Baltimore 90 mm	4	3	1	4
33% of the surface - Baltimore 180 mm	1	1	0	1

COMBINATIONS WITHOUT THE B MODULE OF THE BALTIMORE 180 mm:

PILLARS

General note

For a result that limits joint alignment while adding solidity, it is important to follow the illustrated instructions below. It is also important to adequately glue each row with a concrete adhesive in order to obtain a stable pillar.

If you are planning to install a light on top of the pillar, make sure you run the electrical wires prior to installing the blocks.

If you are planning to build a pillar with a planter, make sure to install a geotextile membrane inside the pillar before filling the cavity with planting soil.

Installation outline

01 EXCAVATION

A. Before excavating, call all the local utility companies (e.g., phone, gas, electrical) to ensure that the area in which you plan to dig is clear of underground cables or wires. If any are found, please notify the appropriate companies before starting the works.

B. Excavate an area of 40" × 40" (1 m × 1 m) by 8" (200 mm) deep and fill in with 0-3/4" (0-20 mm) crushed stone compacted at 95% of the Proctor.

C. With the help of a rake, grade the bottom of the excavated area. If the natural soil is granular or sandy, we recommend that you compact the soil with a vibrating plate. If the soil is clay-like, change the soil with a blend of lime and crushed stone prior to compaction. Next, cover it with a layer of geotextile fabric to prevent the contamination of the base (clay and 0-3/4" [0-20 mm] crushed stone).

02 FOUNDATION

A. Install the 0-3/4" (0-20 mm) crushed stone base, in 4" (100 mm) lifts with a (minimum 5,000 lbf [22 kN] vibrating plate) compactor.

B. To facilitate compacting, wet the base material thoroughly and compact with a vibrating plate proceeding in all directions. This process should give you the desired height. At this stage, you can verify the final height with the help of a paver.

03 SETTING BED

A. On the compacted crushed base, install two pipes with an outside diameter of 1" (25 mm). Grade the concrete sand with the help of a straight edge (or Quick-E leveler). If the base is not properly graded and smooth, imperfections will be evident in the finishing grade of the pavement.

B. Bedding sand should not be compacted until all paving stones have been laid down. Passing the vibrating plate over the paving stones causes them to settle approximately 3/8" (10 mm) into the bedding sand.

04 STARTER ROW

Place the first four units as illustrated, while making sure that all units are leveled in all directions.

05 SECOND ROW

Proceed with each layer / row as per adjacent illustration.

06 THIRD ROW AND SUBSEQUENT ROWS

Repeat procedure from steps 1 and 2 until you reach the desired height.

07 CROWNING

Crown the pillar using Pillar Caps (Stonedge Pillar Cap and York Pillar Caps).

- For the 24" Pillars, use the 28" × 28" caps.
- For the 28" Pillars, use the 32" × 32" caps.

STEPS

General note

A wide range of options is available for building a Techo-Bloc staircase. The riser may have different heights, depending on the model of block chosen. These models include Escala, Mini-Creta and Suprema. Bullnose, Escala cap, Piedimonte, Portofino or the Prima 14" cap are used as a step and secured with concrete adhesive.

Installation outline

01 INSTALLATION OF THE RISER

Install the riser with the block model selected. For some models (e.g., Mini-Creta 3"), you will need to install two rows when building a riser. In this case, make sure you use the connectors in the right position. Fill in and compact behind the riser with crushed stone.

02 INSTALLATION OF STEP

Install the step modules on top of the riser row. Stagger the joints between the riser and step. The step modules must be secured to the riser modules with concrete adhesive.

03 INSTALLATION OF ADDITIONAL ROWS

Repeat steps 1 and 2.

Installation guide
MANCHESTER FOYER

General information

Carefully read the information in this manual before installing and using the fireplace. Improper installation, operation and maintenance can result in serious injury, fire and/or property damage.

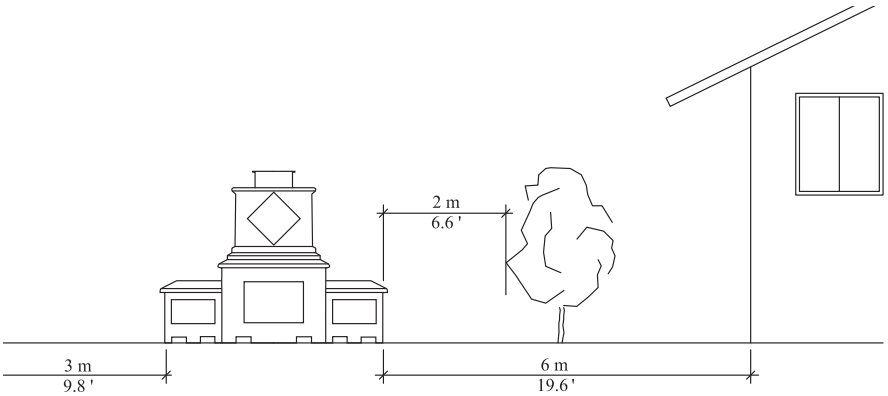
IMPORTANT

Techo-Bloc strongly recommends verifying with your municipality for regulations on the installation and use of the outdoor fireplace prior to installation. We also recommend that you contact your home insurance company and advise them of the acquisition of your new Techo-Bloc fireplace.

LOCATION

This fireplace is for OUTDOOR USE ONLY and should NOT be used inside a building, garage, shed, or any other closed space.

When selecting the area to install a fireplace, make sure to allocate a minimum distance of 19.6 feet (6 m) from any structure or building (e.g. house, garage, gazebo, etc.). Check local regulations to determine how far from the building, other structures, and property lines the fireplace must be placed.



Make sure that there is nothing directly above the fireplace area that can be a potential fire and/or injury hazard, such as tree branches, awnings, patio umbrellas, electrical wires, transformers, etc.

Preparation: foundation

01 Determine where you want to locate your fireplace in your yard or patio. Keep in mind that this is a pre-built unit, and that your contractor or distributor will need access to deliver the unit.

02 Excavate as necessary for the concrete foundation. The foundation must be built according to your local building code. Check with your municipality and local building code for requirements for fireplace foundations.

03 The following drawings are for informational purposes only; they are not site specific. It is the installer's sole responsibility to verify all measurements and local regulations prior to construction.

Installing your fireplace

01 Remove the shipping straps from the fireplace and insert the forklift forks between the openings in the base.

02 Place the base on the level concrete base (see Preparation: foundation in previous section)

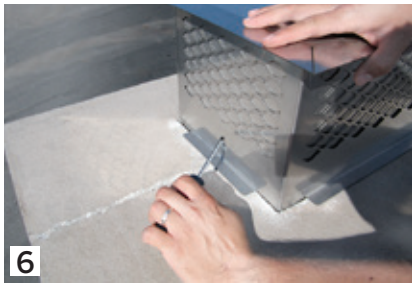
03 Install the filler blocks in the fork holes.

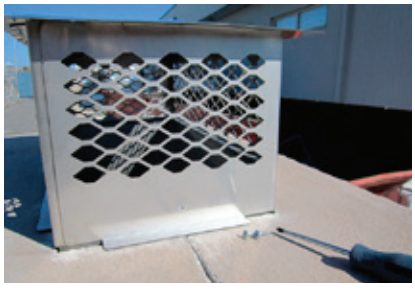
Installation guide
MANCHESTER FOYER

04 Remove the shipping straps that hold the top unit to the skid.

05 Insert the forks of the lifting device into the slots in the top unit and lift it onto the base unit. Make sure the two units are precisely aligned using the markings on the base unit, otherwise the flue will not slide down into the proper position.

06 Once the top unit is in place, remove the shipping screws from the flue and slide the flue liner into place. The liner should rest flat on top of the base unit, not on the coping or caps. Make sure the flue slides down to the concrete opening. Re-attach the cap to the flue liner through the holes in the chimney cap.





07 Place the filler blocks into the fork holes.

08 Gently place the wood boxes (if purchased) on either side of the fireplace. Be very careful, as the bullnose or coping will break if it is pushed too hard against the fireplace.

09 You are now ready to start a fire in the fireplace. For best results, you may want to purchase a wood rack at your local hardware store.

NB: If you want a permanent installation, you may glue the units and the filler blocks in place using any paver or masonry glue. Otherwise, avoid glue.

Installation guide

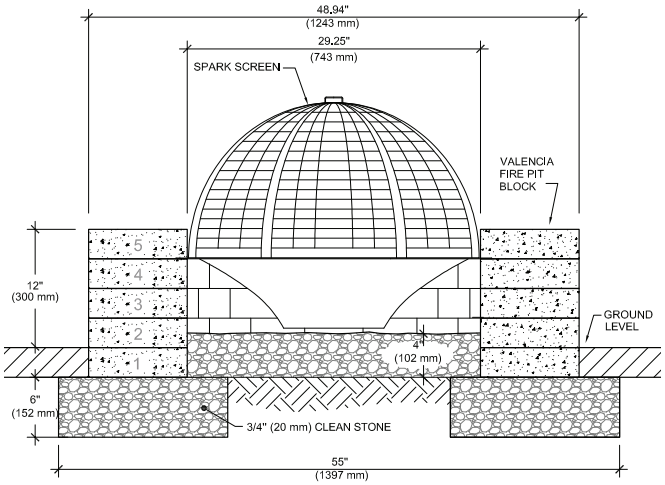
VALENCIA FIRE PIT

Installation outline

01 FOUNDATION

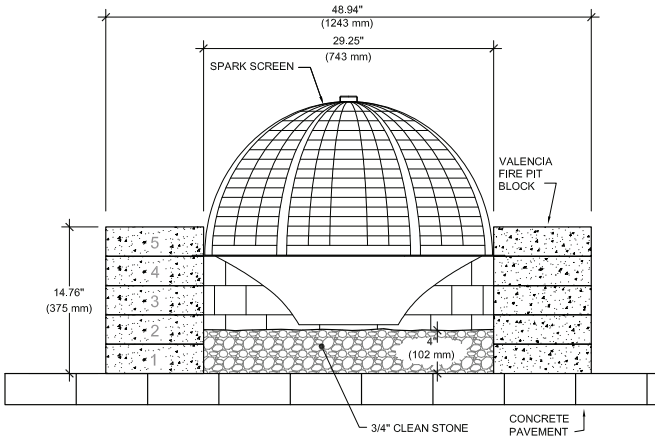
FOUNDATION – OPTION 1
COMPACTED GRAVEL BASE

The Valencia fire pit should be installed on a well-compacted ¾" (20 mm) stone base (minimum of 4" [100 mm]). The first row of Valencia blocks should be embedded below ground level.



FOUNDATION - OPTION 2
CONCRETE BASE OR CONCRETE PAVERS

When installing the fire pit on a concrete base or on concrete pavers, make sure you fill the inside of the fire pit with a layer of sand or ¾" (20 mm) clean stone material. This will allow the filtration of any water that may evacuate through the walls following a rainstorm.



02 STARTER ROW

While laying down the first row of blocks, make sure they are perfectly leveled, then glue the second row of blocks to the first using heat-resistant concrete adhesive. Make sure that the joints of the second row are not aligned with the first row of blocks (crossed joints). This is accomplished by laying the first block of the second row as follows: place the center of the block directly on top of the joint created by the two first-row blocks (see image B). Repeat step 2 until you have achieved the desired height of the fire bowl and continue to step 3. Do not glue the second to last row of blocks, as that is where the log support and fire bowl will be installed.

Note: The Valencia fire pit must be a minimum height of 14.75" (375 mm) including the cap.

03 FIRE PIT

Before installing the last row of blocks (caps), you will need to insert the fire bowl and the log support grill (see image C).

04 INSTALLING CAPS

We strongly recommend against the gluing of caps. When placing the spark screen, make sure it rests on the fire bowl and not on the caps (see images D & E). Finally, you will be required to use the poker stick to remove or place the spark screen when the fire pit is in use. **CAUTION : THE SPARK SCREEN HANDLE BECOMES VERY HOT FROM THE FIRE.**

NOTE:

It is strongly recommended that the sand (or clean stone material) be replaced at the start of each season in order to ensure proper filtration.

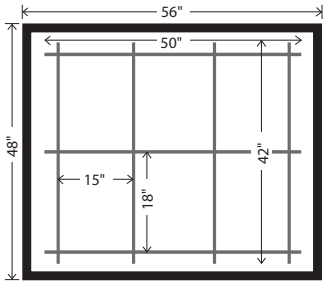
01 CONCRETE PAD PREPARATION

The following drawings are NOT ENGINEERED DRAWINGS. They are provided as a general guidance for the consideration of the installer. Concrete pillars extending to frost line may be required as per local code. Check your local building codes before installing.

Determine the desired location and excavate as necessary to accommodate a minimum of 6" of 3/4" clean stone, 6" of reinforced concrete pad (see drawing below for steel rod placement) and 4" of the pizza oven bottom section below finished grade.

(a)

(b)



(a) #4 rebar (1/2") / (Metric size: 15 M)
(b) 6" concrete slab (4000 psi)

02 INSTALLING BOTTOM SECTION

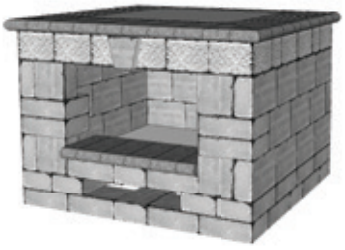
Carefully insert the forklift forks in the openings of the bottom section. Lift the bottom section and place it centered on the concrete pad.

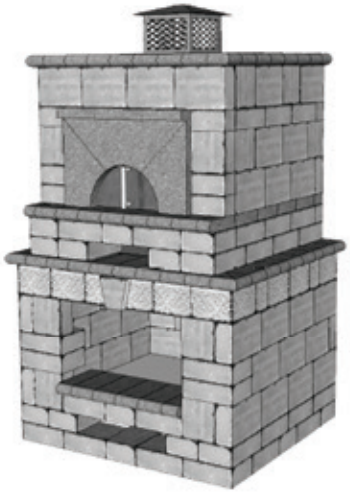
03 INSTALLING TOP SECTION

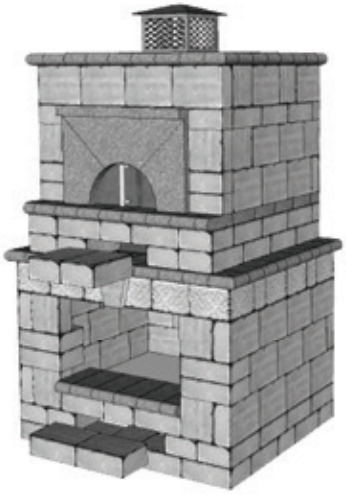
Carefully insert the forklift forks in the openings of the top section. Lift the top section onto the bottom section.

04 FILLER BLOCKS

Place the filler blocks into the fork holes. **Should you want to move the Pizza Oven in the future, do not glue the filler blocks.**







NOTE: The installer must ensure that the installation and use of the pizza oven comply with local regulations and code requirements. The construction of the base should include the installation of a concrete slab and pillars under the slab. The depth of the pillars and reinforcement requirements should be determined based on site conditions and comply with local code.
